SACRAMENTO COUNTY GENERAL NOTES

1. NOTHING ALLOWED IN THE BUFFER AND TRANSITION AREAS AT ALL TIMES.
2. SIGNS ARE ONLY SHOWING TO THE PUBLIC WHEN IN USE.
3. SIGNS AND CHANNELIZING DEVICES MUST BE RETROREFLECTIVE OR ILLUMINATED DURING NIGHT OPERATIONS.
4. SIGN PANEL SIZES: 36"X36" MIN. ON ROADS <50mph, 48"x48" ON ROADS ≥ 50mph.
5. SIGNS ARE SPACED PER THE CALIFORNIA MUTCD 2014 EDITION (REVISION 5), PART 6 DATED DECEMBER 9, 2015 CHANNELIZING DEVICES SPACING AND TAPER LENGTHS ARE BASED ON THEIR RESPECTIVE CHARTS.
6. (SEE CHARTS THIS PAGE)
7. NOTIFY THE LOCAL LAW ENFORCEMENT, FIRE, AND AMBULANCE COMPANIES WITHIN 72 HOURS BEFORE CONSTRUCTION BEGINS.
8. CONTRACTOR TO MAKE SURE ALL TRAFFIC CONTROL EQUIPMENT MEETS ALL AGENCY REQUIREMENTS.
9. REMOVE ALL CONFLICTING MARKINGS FOR LONG TERM OPERATIONS (3 DAYS OR LONGER).
10. THE LOCATION OF THE SIGNS AS SHOWN ON THE ILLUSTRATIONS ARE GUIDELINES AND ACTUAL LOCATIONS WILL DEPEND UPON ALIGNMENT, GRADE, LOCATION OF STREET INTERSECTIONS AND 85TH % TILE/POSTED SPEED LIMITS/OR PRIMA FACIE.
11. WHILE CROSSING INTERSECTIONS DURING MOBILE WORK, WORK MUST FOLLOW THE FLOW OF TRAFFIC AND PROCEED ON A GREEN LIGHT.
12. FULL COMPLIANCE IS REQUIRED WITH THE COUNTY AGENCY.(AFFECTS NOTES #20 THRU 22, BELOW)
13. PEDESTRIAN ACCESS SHALL BE MAINTAINED AS PER THE 2016 SAC COUNTY CONST SPECS, SECTION 12-2.02.
14. C30 SIGNS ARE PERMITTED IN BUFFER AREAS.
15. SIGN SPACING IS PROVIDED IN THE CALIFORNIA MUTCD 2014 EDITION (REVISION 5), PART 6 DATED DECEMBER 9, 2015. TRAFFIC SPEEDS ARE BASED UPON RADAR MEASUREMENTS OF MOTORISTS. THE MUTCD ALLOWS FOR A "RANGE" IN SIGN PLACEMENT AND WILL BE PROVIDED BY DOT. THE 85TH% TILE IS USED WHEN AVAILABLE TO PROVIDE A MORE ACCURATE REPRESENTATION OF MOTORISTS SPEEDS.
16. ANY WORK THAT MIGHT AFFECT A SIGNALIZED INTERSECTION WILL REQUIRE CONTACT AND COORDINATION WITH COUNTY AGENCY PRIOR TO ANY WORK.
17. QUALITY STANDARD TO MEET REQUIREMENTS OF SECTION 1A-2 OF THE CALIFORNIA MANUAL ON UNIFORM TRAFFIC CONTROL DEVICES.
18. ALL TRAFFIC CONTROL DEVICES INCLUDING: SIGNS, BARRICADES, VERTICAL PANELS, DRUMS, WARNING LIGHTS, ARROWBOARDS, CHANGEABLE MESSAGE SIGNS, CONES AND TUBULAR MARKERS THAT MEET THE REQUIREMENTS OF AMERICAN TRAFFIC SAFETY SERVICES ASSOCIATION (ATSSA). "CALIFORNIA MUTCD 2014 EDITION (REVISION 5), PART 6 DATED DECEMBER 9, 2015" SHALL BE USED ON THIS PROJECT/WORK.
19. THE NCHRP REPORT 476 PROVIDES GUIDELINES FOR DESIGN AND OPERATION OF NIGHTTIME TRAFFIC CONTROL FOR HIGHWAY MAINTENANCE AND CONSTRUCTION. SEE TYPICAL APPLICATIONS NWTA-1 THROUGH NWTA-7. COMPLY WITH ANSI 107-2004 FOR APPAREL. HIGHWAY CONSTRUCTION WORK LIGHTING SHALL BE PER CONSTRUCTION SAFETY ORDER 1523 (CALIFORNIA CODE OF REGULATIONS TITLE 8, DIVISION1, CHAPTER 4, SUBCHAPTER 4, ARTICLE 3, SECTION 1523 - ILLUMINATIONS).
20. SIDEWALKS AT THE CONSTRUCTION LOCATION MAY BE CLOSED WITH ADEQUATE DETOURS. SIDEWALKS MAY ONLY BE CLOSED TO THROUGH TRAFFIC AND SHALL NOT PREVENT LOCAL PEDESTRIANS ACCESS. DETOURS SHALL NOT INCREASE THE PATH OF TRAVEL BY MORE THAN 500 FT. TO THE MAXIMUM EXTENT FEASIBLE, THE ALTERNATE CIRCULATION PATH SHALL BE PROVIDED ON THE SAME SIDE OF THE STREET AS THE DISRUPTED ROUTE. WHERE IT IS FEASIBLE TO PROVIDE A SAME-SIDE ALTERNATE CIRCULATION PATH AND PEDESTRIANS WILL BE DETOURED, SECTION 6D.02 OF THE CALIFORNIA MUTCD 2014 EDITION (REVISION 5), PART 6 DATED DECEMBER 9, 2015 SPECIFIES THAT THE ALTERNATE PATH PROVIDE A SIMILAR LEVEL OF ACCESSIBILITY TO THAT OF THE EXISTING DISRUPTED ROUTE . THIS MAY INCLUDE THE INCORPORATION OF ACCESSIBLE PEDESTRIAN SIGNALS (APS), CURB RAMPS, OR OTHER ACCESSIBILITY FEATURES.
21. PEDESTRIAN PATHS SHALL BE MAINTAINED UNOBSTRUCTED OR SHALL BE TEMPORARILY REDIRECTED IN ACCORDANCE WITH SAC COUNTY M&O PLANS TC-45 AND TC-45.1.
22. DURING WORK HOURS, AT LEAST ONE WORKER SHALL BE ASSIGNED WITH THE RESPONSIBILITY TO ESCORT ELDERLY, DISABLED OR ANY OTHER PEDESTRIANS IN NEED OF ASSISTANCE THROUGH THE CONSTRUCTION SITE. A WORKER ASSIGNED WITH THIS RESPONSIBILITY MAY ALSO PARTICIPATE IN OTHER CONSTRUCTION ACTIVITIES; HOWEVER, THE ASSIGNED WORKER SHALL BE AWARE OF HIS OR HER RESPONSIBILITIES FOR PROVIDING THIS ASSISTANCE. MEASURES THAT SIMPLY CLOSE THE SIDEWALK, WITH THE EXCEPTION THAT PEDESTRIANS WILL CROSS SOMEWHERE ELSE DOES NOT ADEQUATELY SATISFY PEDESTRIAN ACCESS. PEDESTRIANS SHOULD NEVER BE DIRECTED/ EXPECTED TO CROSS A MULTI-LANE ROADWAY AT ANY LOCATION OTHER THAN AT A SIGNAL (OR ALL-WAY STOP). ACCOMMODATIONS SHOULD BE MADE ON THE SAME SIDE OF ROADWAY AS WORK.
23. FLAGGER STOPS PEDESTRIAN UNTIL PEDESTRIAN PATH HAS BEEN RE-ESTABLISHED. MAXIMUM LENGTH OF DELAY = 2 MINUTES.

TABLES CHART - SAC COUNTY

Posted Speed	Taper (L) Formula	Buffer Space	Minimum Taper Lengths									Maximum *Cone Spacing		Sign Spacing	LIDG (Ft)
			10' Offset			11' Offset			12' Offset						
			L Merge	1/2 L Shift	1/3 L Shoulder	L Merge	1/2 L Shift	1/3 L Shoulder	L Merge	1/2 L Shift	1/3 L Shoulder	@ Taper	Taper & LIDG		
25	$L = \frac{WS^2}{60}$	155'	104'	52'	35'	115'	57'	38'	125'	63'	42'	25'	13'	100' - 200'	94'
30		200'	150'	75'	50'	165'	83'	55'	180'	90'	60'	30'	15'	120' - 240'	113'
35		250'	204'	102'	68'	225'	112'	75'	245'	123'	82'	35'	18'	140' - 280'	131'
40		305'	267'	133'	89'	293'	147'	98'	320'	160'	107'	40'	20'	160' - 320'	150'
45	L = WS	360'	450'	225'	150'	495'	248'	165'	540'	270'	180'	45'	23'	360' - 540'	169'
50		425'	500'	250'	167'	550'	275'	183'	600'	300'	200'	50'	25'	400' - 600'	197'
55		495'	550'	275'	183'	605'	303'	202'	660'	330'	220'	50'	28'	440' - 660'	210'
60		570'	600'	300'	200'	660'	330'	220'	720'	360'	240'	50'	30'	480' - 720'	225'
65		645'	550'	275'	183'	605'	303'	202'	660'	330'	260'	50'	33'	520' - 780'	244'
70		730'	500'	250'	167'	550'	275'	183'	600'	300'	280'	50'	35'	560' - 840'	263'

Both are based on.
1) 85th %Tile or if not available, then use
2) Posted Speed Limit (PSL)

L = Taper Length
S = Speed W = Width (Offset from path of travel
LIDG = Lateral Intrusion Deterrence Gap
(Ref: Ontario Traffic Manual - Book 7)

*Cones shown on the templates are illustration purposes only. Exact number of cones required shall be based on cone spacing, taper lengths, actual field conditions, etc.

OUR COMMITMENT TO SUSTAINABILITY | ESA helps a variety of public and private sector clients plan and prepare for climate change and emerging regulations that limit GHG emissions. ESA is a registered assessor with the California Climate Action Registry, a Climate Leader, and founding reporter for the Climate Registry. ESA is also a corporate member of the U.S. Green Building Council and the Business Council on Climate Change (BC3). Internally, ESA has adopted a Sustainability Vision and Policy Statement and a plan to reduce waste and energy within our operations. This document was produced using recycled paper.

EXECUTIVE SUMMARY

In an effort to reduce flood risk in the Sacramento Region, the U.S. Army Corps of Engineers (Corps), the Central Valley Flood Protection Board, and the Sacramento Area Flood Control Agency have partnered to complete the American River Common Features 2016 Project (Project). In July 2018, Congress granted the Corps construction funding to complete this urgent flood control project under the Bipartisan Budget Act of 2018.

Most of the Project's environmental effects were addressed in the Revised 2016 American River Common Features General Reevaluation Report (ARCF GRR), Final Environmental Impact Statement/Environmental Impact Report (EIS/EIR) (Corps, 2016). This report was prepared to support a supplemental National Environmental Policy Act (NEPA) and California Environmental Quality Act (CEQA) analysis by characterizing terrestrial wildlife species and the natural communities along the Lower American River (LAR) covering approximately 134.12 acres from approximately river mile (RM) 5.0 to RM 7.8. This reach is referred to as Subreach 2 and is one of four recently established subreaches along the LAR for the Project. It is important to note that Subreach 2 is within the area identified in the GRR as Reach A for both the American River North (ARN) and American River South (ARS) study basins. The survey area encompasses a large portion of Subreach 2; it includes three sites which have been identified as having an unacceptable risk of levee failure due to erosion. Erosion protection measures have been proposed for these sites to improve the levees. The survey area includes the three sites, their associated work areas, staging areas, access routes, and associated buffers. Two buffer areas were established for the survey: a 100-foot buffer where the survey area abuts residential and commercial neighborhoods, and a 500-foot buffer in parkway areas along the Lower American River where the potential for sensitive species to be present is higher.

Although the constructed levee system and surrounding infrastructure have modified most of the survey area's native vegetation types and habitats, remnant stands of native vegetation are present. Natural communities present in the survey area include riverine (open water), annual grassland, mixed oak woodland, upland scrub, riparian scrub, and riparian woodland. Several sensitive natural communities (present in the aforementioned communities) also occur within the survey area. The natural communities were cross referenced with the California Wildlife Habitat Relationships System, which describes predominant wildlife species observed in these communities. Non-native communities and disturbed/developed areas that do not correspond to natural communities are also present in the survey area. Although these areas generally provide fewer habitat opportunities for wildlife, they may still provide cover and forage for some species.

One California species of special concern, the western pond turtle, was observed during field surveys in the survey area. In addition, although it was not observed, the Federally listed threatened valley elderberry longhorn beetle was assumed present based on the occurrence of its host plant and exit holes indicating its presence. Several other sensitive species have high potential to occur in the survey area, including nesting migratory birds and raptors and protected bat species.

CHAPTER 1
Introduction

1.1 Background and Purpose

The U.S. Army Corps of Engineers (Corps), the Central Valley Flood Protection Board, and the Sacramento Area Flood Control Agency are partnering to complete the American River Common Features 2016 Project (Project) to reduce flood risk for the Sacramento region. This report was prepared to support a supplemental environmental analysis of planned levee improvements to address erosion within Subreach 2, one of the four subreaches of the leveed reach of the American River that have been established for the purposes of analysis for this Project. Although most of the Project's environmental effects were addressed in the 2016 *American River Common Features General Reevaluation Report, Final Environmental Impact Statement/Environmental Impact Report* (ARCF GRR EIS/EIR), a supplemental environmental analysis under the National Environmental Policy Act (NEPA) and California Environmental Quality Act (CEQA) is underway to address the environmental effects of changed circumstances and new information regarding the Project that were not covered in the ARCF GRR EIS/EIR.

Subreach 2 is located along the Lower American River (LAR) from river mile (RM) 5.2 to RM 7.8. This subreach is the most hydraulically constrained and thus was the first to undergo an analysis of potential erosion repairs. Within Subreach 2, three sites requiring levee modification were identified: Site 2-1, Site 2-2, and Site 2-3. Subreach 2 is within the area identified in the GRR as Reach A for both the American River North (ARN) and American River South (ARS) study basins.

The intent and scope of this report are to characterize biological resources present within the survey area, which includes the three project sites, their associated work areas, staging areas, access routes, and associated buffers. Two buffer areas were established for the survey: a 100-foot buffer where the survey area abuts residential and commercial neighborhoods, and a 500-foot buffer in parkway areas along the Lower American River where the potential for sensitive species to be present is higher. The surveys focused on terrestrial wildlife and natural communities that could provide habitat for these species. The regulatory context for the Project is presented in **Appendix A**.

1.2 Property Location

The project area, American River Contract 1, also referred to as Subreach 2, is located in the LAR, Sacramento, and extends from RM 5.2 to 7.8, , between Paradise Bend and the Howe Avenue boat launch (**Figure 1**). The LAR drains into the Sacramento River approximately five miles downstream of the survey area. Residential neighborhoods and the Campus Commons Golf

Course lie to the east; and California State University, Sacramento, and additional residential neighborhoods are south and west of the survey area (**Figure 2**).

The survey area includes three sites requiring levee modification, along with their associated staging areas and access roads, between RM 5.0 and RM 7.8 (Figure 2):

- *Site 2-1* encompasses 0.8 miles of the left (west) bank of the LAR between RM 5.2 and RM 6.6. At this site, a minimal-width (20-foot) bench separates the levee toe from the river. The site extends from Glen Hall Park, at Paradise Bend, to California State University, Sacramento's Desmond Hall student housing building, approximately 0.15 RM upstream otf the H Street Bridge.
- *Site 2-2* is located on the right (north) bank, extending from about 250 feet upstream of the Howe Avenue Bridge to about 900 feet downstream of the bridge, i.e., from RM 7.45 to RM 7.7.
- *Site 2-3* is located on the right (north/east) bank and extends from about RM 7.2 downstream to RM 5.9, located along the Campus Commons Golf Course, crosses the H Street Bridge and the Guy West Bridge, and its upstream end is approximately across from the E. A. Fairbairn Water Treatment Plant's intake facility.

CHAPTER 2
Methods

2.1 Survey Area

In this report, the term "survey area" refers to the area where direct, indirect, or cumulative effects on biological resources could occur as a result of the proposed levee work. This area includes the three levee modification sites and the associated staging areas and access roads. The footprint of proposed Project activities was generally the starting point for defining the biological survey area; however, in practical terms, biological resources have varied sensitivity to disturbance and many species need a somewhat larger survey area. The Project's survey area therefore includes the footprint of the proposed facilities, plus a buffer ranging from approximately 100 feet to 500 feet, depending on habitat quality and access (Figure 2).

2.2 Survey Methodology

2.2.1 Survey Dates and Survey Personnel

ESA wildlife biologist Christy Dawson and botanist Joseph Sanders conducted a reconnaissance-level wildlife survey and habitat assessment of the survey area on June 28, 2019. The survey was conducted to observe and characterize vegetation communities, previously mapped in 2018, to assess habitat quality, and to determine the potential for common and special-status wildlife species to occur.

In addition to this general survey, focused surveys for valley elderberry longhorn beetle (VELB) were conducted by ESA biologists Kelly Bayne and Laura Dodson and ESA botanist Joseph Sanders from August 22 to August 30, 2018. These surveys were performed in accordance with methods described in U.S. Fish and Wildlife Service (USFWS) publications for VELB (USFWS, 1999, 2017).

2.2.2 Natural Communities and Vegetation Surveys

Vegetation communities were surveyed in the survey area in August 2018 to map natural and sensitive communities to the alliance level as described in the *Manual of California Vegetation*. Protocol-level botanical surveys were also conducted for the survey area and reported separately from this report.

2.2.3 Wildlife Surveys

The wildlife surveys cataloged any common or special-status wildlife species observed in the survey area and determined the potential for the presence of suitable habitat for special-status

wildlife species. The wildlife surveys were performed by walking meandering transects over the entire survey area to identify features that support wildlife species. A record was kept of all wildlife species encountered. Special-status species were mapped and global positioning system coordinates were collected for each occurrence.

2.3 Review of Background Information

Before conducting reconnaissance-level vegetation and wildlife surveys, ESA reviewed publicly available and subscription-based data on biological resources. The field surveys provided partial confirmation of the accuracy of publicly available data. The following data sources assisted in this analysis:

- Topographic maps (Sacramento East and surrounding eight 7.5-minute quadrangles)
- Historic and current aerial imagery
- California Wildlife Habitat Relationships database
- The California Department of Fish and Wildlife (CDFW) California Natural Diversity Database (CNDDB)
- The California Native Plant Society online database
- A USFWS species list

In addition to the above resources, background information for the Project can be found in the ARCF GRR Final EIS/EIR (Corps, 2016), which was reviewed during preparation of this report.

CHAPTER 3
Environmental Setting

3.1 Natural Communities and Associated Wildlife Habitats

Natural communities are assemblages of plant species that occur together in the same area, and are defined by species composition and relative abundance. The natural communities described here are largely consistent with the CDFW natural communities, which comply with the National Vegetation Classification Standard. These communities were crosswalked from previously mapped alliances, in accordance with the membership rules described in the *Manual of California Vegetation* (Sawyer et al. 2009). A crosswalk table is presented in **Appendix A**.

Botanical taxonomy and nomenclature conform to *The Jepson Manual: Vascular Plants of California, second edition* (Baldwin et al., 2012), as revised by the Jepson eFlora (Jepson Flora Project, 2019). Common names of plant species are derived from the Jepson Manual or Calflora (2019). Plant communities generally correlate with wildlife habitat types; wildlife habitats were classified and evaluated using *A Guide to Wildlife Habitats of California* (Mayer and Laudenslayer, 1988).

Natural communities present in the survey area include riverine (open water), annual grassland, mixed oak woodland, upland scrub, riparian scrub, and riparian woodland, all of which support various life stages for a wide array of wildlife. Non-native communities, invasive plants, and disturbed/developed areas that do not correspond to natural communities also are present in the survey area. Although these areas generally provide fewer habitat opportunities for wildlife, they may still provide cover and forage. **Figures 3a** through **3c** identify the distribution of native and non-native communities in the survey area.

Appendix B, Tables B-1 and B-2, respectively, present lists of wildlife and plant species that were observed during focused and reconnaissance-level surveys.

3.1.1 California Annual Grassland

Grasslands can be found throughout the survey area, typically in upland areas, and consist mainly of non-native grasses and forbs.[1] Common grass species observed in this community include wild oat (*Avena barbata*), bromes (*Bromus diandrus, B. hordeaceus*), foxtail barley (*Hordeum murinum*), rattail sixweeks grass (*Festuca myuros*), Bermuda grass (*Cynodon dactylon*), and Pacific bentgrass (*Agrostis avenacea*). Pockets of native grasses such as beardless wild rye

[1] Annual grasslands were previously called "ruderal herbaceous" in the 2016 ARCF GRR EIS/EIR.

(*Elymus triticoides*) and purple needle grass (*Stipa pulchra*) occur sporadically throughout the grasslands in the survey area as well.

An assemblage of native and non-native forbs also occurs in these grasslands. Among the many common non-native forbs observed are hairy vetch (*Vicia villosa*), cutleaf geranium (*Geranium dissectum*), Italian thistle (*Carduus pycnocephalus*), yellow star thistle (*Centaurea solstitialis*), prickly lettuce (*Lactuca serriola*), poison hemlock (*Conium maculatum*), wild radish (*Raphanus sativus*), wild mustard (*Hirschfeldia incana*), rose clover (*Trifolium hirtum*), and white sweet clover (*Melilotus indicus*). Some common native forbs observed include Canada horseweed (*Erigeron canadensis*), telegraph weed (*Heterotheca grandiflora*), ragweed (*Ambrosia psilostachya*), elegant clarkia (*Clarkia unguiculata*), and turkey-mullein (*Croton setiger*).

The species composition and structure of grasslands in the survey area vary. Some areas are relatively homogeneous, dominated by one or two species such as yellow star thistle and Bermuda grass, and other areas are much more heterogeneous, with several species occurring. Also, although annual grasslands occur on levee slopes, most of these areas are mowed regularly and thus may provide fewer habitat opportunities for some wildlife species than unmowed grassland areas.

Wildlife Habitat Relationship with California Grassland

Annual grassland provides little cover for most wildlife, yet numerous species forage and several species breed in this habitat type. Grasslands attract bumblebees and other insects that rely on flowering grassland species. They also attract reptiles and amphibians, such as western fence lizard (*Sceloporus occidentalis*), common garter snake (*Thamnophis sirtalis*), and gopher snake (*Pituophis melanoleucus*); and birds, including California quail (*Callipepla californica*), western bluebird (*Sialia mexicana*), lesser goldfinch *(Carduelis psaltria*), and barn swallow (*Hirundo rustica*).

Common small mammals expected to occur in grasslands in the survey area include western harvest mouse (*Reithrodontomys megalotis*), deer mouse (*Mus musculus*), California vole (*Microtus californicus*), black-tailed jackrabbit (*Lepus californicus*), and Botta's pocket gopher (*Thomomys bottae*). Small rodents, reptiles, and invertebrates attract raptors (birds of prey) including red-tailed hawk (*Buteo jamaicensis*), red-shouldered hawk (*Accipiter striatus*), and American kestrel (*Falco sparverius*), and special-status birds such as white-tailed kite (*Elanus leucurus*), burrowing owl (*Athene cunicularia*), and Swainson's hawk (*Buteo swainsoni*).

Non-native grasslands are important foraging grounds for aerial and ground-foraging insect eaters such as *Myotis* bat species and pallid bats. Larger mammals such as black-tailed deer (*Odocoileus hemionus*) and coyote (*Canis latrans*) were observed regularly moving through grasslands in the survey area during the biological resources surveys conducted in 2018 and 2019.

3.1.2 Mixed Oak Woodland and Upland Scrub

Oak Woodland

Oak woodlands within the survey area are dominated by coast live oak (*Quercus agrifolia*), valley oak (*Q. lobata*), and interior live oak (*Q. wislizeni*); Northern California black walnut (*Juglans hindsii*) and California bay (*Umbellularia californica*) are less frequent contributors to the tree canopy.

Oak woodlands in the survey area support a variety of understory plant species and vegetative structures. When no shrub layer is present, an annual grassland is the dominant understory and includes the common species described above for the California annual grassland community description. When oak woodlands support understory shrubs, common native shrubs observed include California rose (*Rosa californica*), California blackberry (*Rubus ursinus*), blue elderberry (*Sambucus nigra* ssp. *caerulea*), and coyote brush (*Baccharis pilularis* ssp. *consanguinea*). Himalayan blackberry (*Rubus armeniacus*) was the only common non-native shrub observed in the understory of oak woodlands.

Oak woodland is considered a sensitive natural community by CDFW and includes Great Valley valley oak/oak riparian forest.

Upland Scrub

Upland scrub habitat in the survey area consists of areas dominated by native and non-native shrubs that have no tree cover and contain the common herbaceous species described above for California annual grassland. Common native shrub species observed are coyote brush, blue elderberry, California rose, California blackberry, California grape (*Vitis californica*), and western redbud (*Cercis occidentalis*).

Wildlife Habitat Relationships with Mixed Oak Woodland and Upland Scrub

Animals within oak woodland habitat in the survey area include those heavily reliant on acorns, such as the acorn disseminators western scrub jay (*Aphelocoma californica*), acorn woodpecker (*Melanerpes formicivorus*), and western gray squirrel (*Sciurus griseus*). Wild turkey (*Meleagris gallopavo*), California quail, and black-tailed deer use acorns as a major food source.

Deer also use the foliage of several hardwoods. Oak titmouse (*Baeolophus inornatus*), dark-eyed junco (*Junco hyemalis*), ash-throated flycatcher (*Myiarchus tuberculifer*), northern flicker (*Colaptes auratus*), lesser goldfinch (*Carduelis psaltria*), and great horned owl (*Bubo virginianus*) nest in woodland habitat. Cavity nesters include western bluebird, and ash-throated flycatcher. Special-status birds such as Cooper's hawk (*Accipiter cooperii*) and sharp-shinned hawk (*A. striatus*) are known to nest in these woodlands. The pallid bat, also a special-status species, may inhabit these woodlands as well.

Amphibians and reptiles can be found on the forest floor where moisture is retained under fallen wood and in tree crevices; among these species are California toad (*Anaxyrus boreas halophilus*)

and Sierran treefrog (*Pseudacris sierra*). Reptiles include western fence lizard, southern alligator lizard (*Elgaria multicarinata* ssp. *multicarinata*), ringneck snake (*Diadophis punctatus*), gopher snake, western rattlesnake (*Crotalus viridis helleri*), and California king snake (*Lampropeltis zonata*). Many of these species will also use adjacent upland scrub areas for foraging or cover.

3.1.3 Valley Foothill Riparian

Riparian Scrub

Riparian scrub habitat in the survey area consists of shrub-dominated areas that are subject to hydrologic influence from the LAR. These areas are dominated by sandbar willow (*Salix exigua*), arroyo willow (*S. lasiolepis*), common button bush (*Cephalanthus occidentalis*), California rose, California blackberry, California wild grape, blue elderberry, and Himalayan blackberry. Areas that experience high flows typically do not support herb species and cobbles tend to be the dominant ground cover. Areas that experience slower flows support a variety of herb species including mugwort (*Artemisia douglasiana*), marsh brittlegrass (*Setaria parviflora*), Santa Barbara sedge (*Carex barbarae*), horsetails (*Equisetum arvense* and *E. hymale* ssp. *affine*), rushes (*Juncus balticus*, *J. bufonius*, *J. effusus*, and *J. patens*), beardless wildrye (*Elymus triticoides*), and water iris (*Iris pseudacorus*).

Riparian Woodland

Riparian woodlands in the survey area are tree-dominated areas that are subject to frequent hydrologic influence from the LAR. These areas are dominated by Fremont cottonwood (*Populus fremontii*), Goodding's willow (*Salix gooddingii*), red willow (*S. laevigata*), white alder (*Alnus rhombifolia*), Oregon ash (*Fraxinus latifolia*), and/or California sycamore (*Platanus racemosa*). Pacific willow (*Salix lasiandra*), valley oak, American elm (*Ulmus americana*), and black locust as less frequent contributors to the tree canopy. Riparian woodlands support a variety of shrubs and herbs similar to those described above for the riparian scrub community.

Wildlife Habitat Relationships with Valley Foothill Riparian

Many wildlife species are dependent on riparian habitats for water, food, and cover. Several species of raptors—red-shouldered hawk, Cooper's hawk, great horned owl, and the State-listed Swainson's hawk—build their nests in the crowns of cottonwood, valley oak, and other large trees that grow on the landside and waterside of the levees in the survey area. Natural cavities and woodpecker holes provide nesting sites for cavity-nesting species, including wood duck (*Aix sponsa*), common merganser (*Mergus merganser*), American kestrel, tree swallow (*Tachycineta bicolor*), western bluebird, and western screech owl (*Megascops kennicottii*).

Riparian scrub supports large numbers of insects and attracts passerine birds, including several species of flycatchers, warblers, and hummingbirds. In addition, a number of Federally listed species rely on riparian corridors, including VELB and the western yellow-billed cuckoo. Riparian habitat is listed as a sensitive natural community by the CNDDB (CDFW, 2018) and includes Great Valley cottonwood riparian forest and Northern California black walnut.

3.1.4 Riverine

Riverine habitat includes inundated areas including the LAR. Such areas support some submerged aquatic vegetation including Brazilian waterweed (*Egeria densa*), curly pondweed (*Potamogeton crispus*), and water primrose (*Ludwigia hexapetala*).

Shaded Riverine Aquatic Habitat

Shaded riverine aquatic habitat is defined as the nearshore aquatic area located at the interface between a river and adjacent woody riparian habitat. This valuable cover type has two principal attributes: (1) The adjacent bank is composed of natural, eroding substrates supporting riparian vegetation that either overhangs or protrudes into the water; and (2) the water contains variable amounts of woody debris, such as leaves, logs, branches, and roots, as well as variable depths, velocities, and currents. Shaded riverine aquatic habitat is present throughout the survey area along the riverbanks and levees and is contained within the other identified habitat types in these areas.

Wildlife Habitat Relationships with Riverine

Many bird species use open waters for resting, hunting, and escape cover. Common species include gulls, waterfowl, osprey (*Pandion haliaetus*), and bald eagle (*Haliaeetus leucocephalus*). Shorelines provide hunting grounds for wading birds such as herons and egrets, and for kingfisher, waterfowl, and shorebirds. Flycatchers, swallows, and other insectivorous birds catch their prey over water. Mammal species that occur in this habitat type include river otter (*Lontra canadensis*) and beaver (*Castor canadensis*).

3.1.5 Disturbed/Developed

The levee system has substantially altered the habitat within the LAR parkway and surrounding areas are urbanized. In addition to the levee system, existing facilities in the survey area include a golf course, a bike path, a large pump facility, and three bridges (Figure 3). Staging and access areas are located mostly in existing parking areas, open parks, and on existing gravel or paved roads and paths. Disturbed portions of the survey area include bare ground or manicured areas that are subject to continued disturbance.

Invasive Plant Species

In the survey area, invasive non-native plant species occur in all plant communities, but most commonly with and adjacent to annual grasslands. Areas dominated by non-native vegetation are generally associated with recent human disturbance and include dredged mine tailings, maintained levee slopes, landscaped areas, and areas subject to frequent flood inundation or scour. Non-native weeds dominate some areas, especially along the side slopes of the levees. To a lesser degree, invasive plants are also found in other plant communities such as riparian and oak woodland.

Non-native Woodland

Several locations in the survey area are dominated by non-native trees. These single-species tree stands consist of either Australian pine (*Casuarina equisetifolia*), black locust (*Robinia pseudoacacia*), or tree of heaven (*Ailanthus altissima*). With the exception of black locust stands, non-native woodlands in the survey area do not support a shrub understory, and are dominated by the common herbaceous species described above for California annual grassland. Some black locust stands support blue elderberry shrubs in the understory.

Irrigated Turf

The Campus Commons Golf Course and University Park contain irrigated lawns that are mowed regularly and are dominated by Bermuda grass. Irrigated turf is not considered a sensitive natural community.

Wildlife Habitat Relationships with Disturbed/Developed

The survey area outside of the LAR parkway combines urban residential zones featuring lawns, shade trees, and ornamental plants with areas of mature vegetation as encountered in the parks, on the university campus, and along the periphery of the golf course. Although these areas are disturbed, they can still support wildlife, and the more mature areas can sometimes approximate the natural environment. Bird species that may use these habitat types include scrub jay, Northern mockingbird (*Mimus polyglottos*), house finch (*Carpodacus mexicanus*), California quail, and western bluebird. Common mammals include black-tailed deer, raccoon (*Procyon lotor*), and opossum (*Didelphis virginiana*). Gopher snake and western fence lizard also occur in this habitat type.

Wildlife also use manmade structures such as the H Street Bridge, which is being used as a day roost for unidentified bat species (possibly pallid bat [*Antrozous pallidus*] and/or myotis bats [*Myotis* sp.]). Cliff swallows were observed nesting on the Howe Avenue Bridge. The potential also exists for nesting birds to occur in the trees located in the parking lots and dog park that would be used for Project staging areas.

3.2 Special-Status Species

Several wildlife species known to occur in or in the vicinity of the survey area are protected under Federal and/or State endangered species laws or have been designated as species of special concern by CDFW. In addition, Section 15380(b) of the State CEQA Guidelines provides a definition of rare, endangered, or threatened species that are not included in any listing. Species recognized under these terms are referred to collectively as “special-status species.”

A list of special-status wildlife species with potential to occur in or in the vicinity of the survey area was compiled from a nine-quadrangle search of the CNDDB (CDFW, 2019a), a search of the USFWS Information for Planning and Consultation endangered species database (USFWS, 2019), and biological literature of the region. The search encompassed the following 7.5-minute U.S. Geological Survey topographic quadrangles:

Taylor Monument	Rio Linda	Citrus Heights
Sacramento West	Sacramento East	Carmichael
Clarksburg	Florin	Elk Grove

Each species on the list was assessed individually based on its habitat requirements and distribution relative to the location and vegetation communities that occur in and around the survey area. **Table 1** provides a comprehensive list of special-status wildlife species that were considered in the analysis. Those species with a moderate or high potential to occur in the survey area are described below in greater detail. See **Figure 4** for a map of CNDDB special-status species occurrences within five miles of the survey area. If habitat was not present or the survey area is outside of the known range of the species, the species was assumed absent and excluded from the list.

The "Potential to Occur" categories are defined as follows:

- **Low**: The survey area provides only limited and low-quality habitat for a particular species. In addition, the known range for a particular species may be outside of the survey area.
- **Moderate**: The survey area and/or immediate vicinity provides suitable habitat for a particular species.
- **High**: The survey area and/or immediate vicinity provide ideal habitat conditions for a particular species and/or known populations occur in the survey areas or within its immediate vicinity.
- **Present:** The species was observed during the biological surveys within the survey area.

TABLE 1
SPECIAL-STATUS ANIMAL SPECIES CONSIDERED IN THE SURVEY AREA

Common Name Scientific Name	Status Fed/State	Habitat	Potential to Occur
Listed Species			
Invertebrates			
Crotch bumble bee *Bombus crotchii*	–/CP	Open grasslands and scrub habitat in California with available underground nesting habitat in fossorial animal burrows.	**Moderate.** Annual grassland and scrub habitats are available and several commonly visited flower species were identified as occurring in the survey area. However, there are few recent sightings in the vicinity.
Western bumble bee *Bombus occidentalis occidentalis*	–/CP	Nests, forages, and overwinters in meadows and grasslands with abundant floral resources and available underground nesting habitat in fossorial animal burrows. Range is throughout California, but more common in the Sierra Nevada and Coast Ranges than in the Central Valley.	**Low.** Grassland habitat is available, but the western bumble bee is uncommon in the Central Valley.

TABLE 1
SPECIAL-STATUS ANIMAL SPECIES CONSIDERED IN THE SURVEY AREA

Common Name Scientific Name	Status Fed/State	Habitat	Potential to Occur
Valley elderberry longhorn beetle *Desmocerus californicus dimorphus*	FT/–	Mature elderberry shrubs.	**High.** Elderberry plants are present in the survey area. Exit holes observed.
Reptiles			
Giant garter snake *Thamnophis gigas*	**FT**/CT	Permanent or semipermanent water and dense emergent vegetation; freshwater marshes, streams, and canals with permanent water.	**Low.** The American River lacks suitable habitat (USFWS AFRC BO 2014-F-0518).
Birds			
Western yellow-billed cuckoo *Coccyzus americanus occidentalis*	FT/CE	In California, western cuckoos are largely restricted to river valleys in the north-central (e.g., Sacramento River) and southwestern (e.g., Kern River) regions. Western cuckoos prefer to nest in willow (*Salix* spp.), cottonwood (*Populus* spp.), and mesquite (*Prosopis* spp.), but they will also use orchards.	**Moderate.** Vocalization recently documented approximately three miles upstream on a densely forested island in the American River. Submarginal nesting habitat occurs in the survey area, but it may be used by transient birds.
Tricolored blackbird *Agelaius tricolor*	–/CT	Breeds near freshwater in dense emergent vegetation or dense brush.	**Low.** Marginal nesting habitat in the willow riparian area. Closest known occurrence is greater than five miles away.
Swainson's hawk *Buteo swainsoni*	–/CT	Often nests near riparian systems, but will also use lone trees in agricultural fields or pastures and roadside trees when available and adjacent to suitable foraging habitat.	**High.** Known to occur within 0.5 miles of the survey area.
Bank swallow (nesting) *Riparia riparia*	–/CT	Colonial nester mostly along coastal areas and rivers in Northern and Central California. Nesting restricted to vertical banks or bluffs with friable soils suitable for burrowing. Vegetation is varied; nesting sites are selected mostly based on the suitability of the nesting bank.	**Moderate.** Previously observed approximately 0.5 miles downstream of the survey area. No bank nesting habitat observed within the survey area, but may use the survey area for foraging.
Nonlisted Special-Status Species			
Reptiles			
Western pond turtle *Actinemys marmorata*	–/CSC	Variety of aquatic habitats, both permanent and intermittent, with suitable aerial and aquatic basking sites. Needs upland habitats for nesting, overwintering, and aestivating.	**Present**. Observed in the survey area during surveys.
Birds			
Cooper's hawk *Accipiter cooperii*	–/WL	A common migrant and winter resident. Nests and forages in a wide variety of forest and woodland habitats.	**High**. Known to occur within 0.5 miles of the survey area.
Great egret *Ardea alba*	MBTA/–	Colonial nester in large trees. Rookery sites located near marshes, tide flats, irrigated pastures, and margins of rivers and lakes.	**Moderate**. Potential nesting habitat in the survey area. There is an egret rookery approximately five miles upstream of the survey area on the American River.

TABLE 1
SPECIAL-STATUS ANIMAL SPECIES CONSIDERED IN THE SURVEY AREA

Common Name Scientific Name	Status Fed/State	Habitat	Potential to Occur
Great blue heron (rookery site) *Ardea herodias*	MBTA/–	Variety of habitats near sources of water. Nests commonly high in the tops of secluded large snags or live trees.	**Moderate**. Potential nesting habitat in the survey area. There is a heron rookery within five miles downstream of the survey area on the American River.
Burrowing owl *Athene cunicularia*	–/CSC	Nests and roosts in burrows, usually of ground squirrels, in grasslands and ruderal habitats.	**High**. Known to occur in the survey area near the university. Several ground squirrel burrows observed along the levee corridor.
White-tailed kite (nesting) *Elanus leucurus*	–/FP	Savanna, open woodland, marshes, partially cleared lands and cultivated fields, mostly in lowland habitats. Nests in trees, often near marshes.	**High**. Known to occur in the survey area on the south side.
Purple martin *Progne subis*	–/CSC	Nests mostly in old woodpecker cavities; also nests in human-made structures. Nest is often located in tall, isolated trees/snags.	**Moderate**. Potential nesting habitat in the survey area. Known to occur on bridge and overpass structures within one mile of the survey area.
Mammals			
Pallid bat *Antrozous pallidus*	–/CSC	Arid deserts and grasslands of low elevations in California; often near rocky outcrops and water. Usually roosts in rock crevices or buildings, less often in caves, tree hollows, mines, etc. Prefers narrow crevices in caves as hibernation sites.	**High**. This species may roost in buildings and bridges in the survey area; however, roosting is not reported by the CNDDB within five miles of the survey area or within the nine-quadrangle area that includes the survey area.
Western red bat *Lasiurus blossevillii*	–/CSC	Associated with riparian habitat. Roosts primarily in the foliage of trees or shrubs, but may also occasionally use caves. Day roosts commonly in edge habitats.	**High**. This species may roost in mixed oak woodland habitat in the survey area; however, roosting is not reported by the CNDDB within five miles of the survey area or within the nine-quadrangle area that includes the survey area.
American badger *Taxidea taxus*	–/CSC	Requires sufficient food, friable soils to excavate dens and pursue prey, and relatively open, uncultivated ground.	**Moderate.** The potential exists for this species to use the parkway. Although no signs of presence were observed, there were small fossorial mammal burrows and ground squirrel activity. There are two known occurrences within five miles; however, the most recent sighting was from 1991.

Figure 4
Special-status Species Occurrences within 5 miles of the Survey Area

ESA

The analysis below includes consideration of special-status species categorized as present, or with a medium or high potential to occur.

3.2.1 Federally Listed and State-Listed Wildlife Species

Crotch Bumble Bee

The crotch bumble bee was recommended to be added to the State endangered species list and was listed as a candidate species by CDFW in June 2019. It inhabits open grassland and scrub habitats throughout California. Crotch bumble bees primarily nest underground in mammal burrows, but are occasionally observed in old logs and cavities in trees, among other aboveground locations. They are generalist foragers, with short tongues, and thus have a preference for foraging on open flowers with short corollas. They overwinter in soft disturbed soil or under leaf litter (CDFW, 2019b).

This species was historically common throughout the Central Valley, but now is mostly absent. The closest somewhat recent occurrence documented in the CNDDB, last recorded in 1998, was just southwest of Davis, approximately 18 miles west of the Project area. Two more recent occurrences were documented in the CNDDB in 2007; the first was just outside of Fairfield, approximately 36 miles to the southwest, and the second was near the Tisdale Weir in Colusa County, approximately 38 miles to the north. More recent occurrences are in the Sierra Nevada and the Coast Ranges. Nonetheless, suitable habitat occurs in the survey area in annual grassland and scrub habitats.

Valley Elderberry Longhorn Beetle

The valley elderberry longhorn beetle is Federally listed as threatened. Suitable habitat for the VELB is typically defined as live elderberry (*Sambucus* spp.) stems measuring at least one inch in diameter at ground level. These beetles seldom occur above 3,000 feet in elevation. They are generally found along waterways and in floodplains that support remnant stands of riparian vegetation. The VELB is completely dependent on its host plant, the elderberry, which is a common component of the riparian forests and adjacent upland habitats of California's Central Valley and foothills. Elderberry shrubs with VELB populations occur in a variety of habitats and plant communities, but are most often found in riparian areas (USFWS, 1999, 2017).

Records for this species are restricted to small, scattered populations along the Sacramento, American, San Joaquin, Kings, Kaweah, and Tule Rivers and their tributaries. However, the species has the potential to occupy shrubs in the Central Valley and Sierra Nevada foothills. For this reason, elderberry shrubs of sufficient size (measuring at least one inch in diameter at ground level) are considered suitable habitat for this species. There are documented occurrences of VELB in the survey area from 1984, when 11 beetles were captured. Fresh exit holes were observed in 2009 (CDFW, 2019a), 2018 (Environmental Science Associates, 2018), and during this survey.

Yellow-billed Cuckoo

The western yellow-billed cuckoo is a subspecies of the yellow-billed cuckoo and has been recognized through designation of a distinct population segment (USFWS, 2001). In 1988, the cuckoo was listed by the State as endangered under the California Endangered Species Act (CDFW, 2019c). In 2014, the cuckoo was Federally listed as threatened under the Federal Endangered Species Act, and critical habitat was proposed throughout its range, including a 69-mile-long, contiguous segment of the Sacramento River from Red Bluff to Colusa (USFWS, 2014a, 2014b). The cuckoo is typically found in riparian forests with dense deciduous trees and shrubs, primarily in riparian forests and associated bottomlands dominated by willow, cottonwood, or mesquite (Gaines and Laymon, 1984; Laymon and Halterman, 1987; Hughes, 1999; Halterman et al., 2001).

This subspecies was once common throughout California (Grinnell and Miller, 1944), but the population has declined over the last 100 years following extensive loss of riparian habitat. In California, cuckoos are consistently found in only a few isolated areas: the Sacramento Valley (between Red Bluff and Colusa), the Feather River (between Gridley and Nicolaus), the South Fork of the Kern River, and several Lower Colorado River Multi-Species Conservation Program restoration sites on the California side of the lower Colorado River (Gaines and Laymon, 1984; Laymon and Halterman, 1989; Laymon, 1998; Halterman et al., 2001; Dettling and Seavy, 2012).

Until recently, the Upper Sacramento River was believed to have one of the largest cuckoo populations in California. However, surveys have documented a dramatic decline in this population (Halterman et al., 2001; Dettling and Howell, 2011; Dettling et al., 2014). Riparian vegetation in this area has increased by almost 5,000 acres since 1996 as a result of restoration efforts (Golet et al., 2008). Gaines and Laymon (1984) suggested, however, that many large patches along the Sacramento River in Tehama County and along the Feather River appeared to be unoccupied even though they apparently represent suitable habitat. Follow-up surveys were conducted in 1987 and 1999, and between one and six individuals were found along the Feather River between Oroville and Nicolaus (Laymon and Halterman, 1989; Halterman et al., 2001).

Until very recently, the last documented occurrence in the CNDDB in the vicinity of the survey area was from the late 1800s. However, on July 27, 2019, a cuckoo vocalization was documented approximately three miles upstream on a heavily forested island in the American River (Ron Melcer Jr., Delta Stewardship Council, pers. comm., July 28, 2019). The bird was not observed and the nesting status is unknown.

The survey area provides marginal remnant riparian habitat that may be used for foraging or dispersal. However, the riparian habitat in the survey area does not meet the typical size requirements (25 contiguous acres or more) for home ranges of nesting yellow-billed cuckoos (USFWS, 2001).

Swainson's Hawk

Swainson's hawk is State-listed as threatened. It once occupied large grassland and shrub steppe habitats, as well as canyons, foothills, and smaller interior valleys in otherwise mountainous

regions. Currently, the species is most common in the Central Valley and Great Basin. Nesting habitat for Swainson's hawk includes mature trees with relatively dense canopies such as oaks or cottonwoods in or near riparian habitat, agricultural fields, or suburban neighborhoods near suitable foraging habitat. They forage in grasslands, irrigated pastures, and grain fields. In California, Swainson's hawks begin nesting in late March, and the young usually leave the nest (fledge) by August.

The closest CNDDB occurrence of Swainson's hawk is approximately 0.5 miles west of the survey area. The pair was last observed nesting in 2011. A pair was observed in the same vicinity in 2012, but nesting was not confirmed. The most recently documented CNDDB occurrence, in 2017, was a nest approximately 1.5 miles west of the survey area. Additionally, there has been a regularly documented nest just upstream of Howe Avenue (Sorgen, K. C. pers. comm., 2019) and a potential nesting pair was observed in May 2019 by a DWR survey team on the river's right bank just downstream of Watt Ave, approximately 1.4 miles east of the survey area (Lori Price, pers. comm., 2019). The survey area and landscape within 0.5 miles was assessed for potential Swainson's hawk nesting and foraging habitat. The large trees within the riparian corridor and adjacent parks could provide nesting sites and annual grasslands and nearby parks provide suitable foraging habitat.

Bank Swallow

The bank swallow is State-listed as threatened. It is a neotropical migrant that arrives in California in May and breeds before returning to South America in late July or August. Swallows primarily inhabit riparian and lowland habitats with vertical banks, bluffs, and cliffs where they dig holes for nesting in sandy or fine-textured soil (CDFG, 1999a). The species' range in California is estimated to have been reduced by 50 percent since 1900 (CDFG, 1999a). Bank swallow was formerly more common as a breeder in California. Now, only approximately 110–120 colonies remain in the state. Perhaps 75 percent of the current breeding population in California occurs along the banks of the Sacramento and Feather Rivers in the northern Central Valley (CDFG, 1999a).

Historically, a population of nesting bank swallows, was documented in the CNDDB, approximately 0.5 miles downstream of the survey area. The most recent record was from for this location 1986. The closest recent (2017) CNDDB record is from the vicinity of Knights Landing, which is 17 miles from the survey area. Although nesting habitat in the survey area is limited, as the banks are mostly covered in dense vegetation, there is high-quality foraging habitat that bank swallows may use.

3.2.2 Nonlisted Special-Status Wildlife Species

Western Pond Turtle

The western pond turtle is a California species of special concern. This moderate-sized aquatic turtle is commonly found in ponds, lakes, marshes, rivers, streams, and irrigation ditches with rocky or muddy substrates. Its habitat often exhibits shoreline basking areas that may or may not be bordered by aquatic vegetation. Aquatic sites are often within woodlands, grasslands, and open forests, between sea level and 6,000 feet in elevation. Pond turtles bask on logs or other objects when

water temperatures are lower than air temperatures. Their nests are created in upland areas with friable soils, often up to 0.25 miles from an aquatic site (Jennings and Hayes, 1994; Stebbins, 2003; Zeiner et al., 1988).

Western pond turtles are discontinuously distributed throughout California west of the Cascade-Sierran crest (Jennings and Hayes, 1994). They were documented by the CNDDB within the nine-quadrangle area and were observed in the survey area just downstream of the Campus Commons Golf Course, on river right, basking on a log in the water.

Cooper's Hawk

The Cooper's hawk is a CDFW watch list species. This medium-sized accipiter is a resident of wooded areas throughout California, with breeding described throughout the Coast Ranges and Sierra Nevada foothills. The Cooper's hawk forages mostly on small birds and mammals, although it will also take reptiles and amphibians. The species' peak nesting season is May through July, although nesting may occur any time from March to August (Zeiner et al., 1990a).

A Cooper's hawk nest was recorded by the CNDDB within one mile south of the survey area in 2007 (CDFW, 2019a). Woodland habitat in and near the survey area provides potential nesting opportunities for this species.

Western Burrowing Owl

Western burrowing owls are California species of special concern. They inhabit grassland, desert, and open shrub habitats throughout the state from sea level to approximately 5,300 feet (CDFG, 1999b). Unlike many sensitive species, burrowing owls persist and even thrive in some landscapes that are highly altered by human activity. The characteristics of suitable habitat are burrows for roosting and nesting, and relatively short vegetation with only sparse shrubs and taller vegetation. Individuals in agricultural environments nest along roadsides and water conveyance structures. Breeding occurs February through August (CDFG, 2012).

The closest CNDDB occurrence of burrowing owl is just east of Site 2-1 on the university campus and approximately 0.5 miles east of the survey area. The levee and bike path along the project corridor in the survey area, especially Site 2-2, consists of disturbed grasslands with small mammal burrows and ground squirrel activity. This area provides potential nesting habitat for burrowing owl. During reconnaissance-level surveys, no burrowing owls or signs of occupied burrows were found.

White-Tailed Kite

The white-tailed kite is a fully protected species under the California Fish and Game Code. This species nests primarily in riparian and lowland habitats often associated with agricultural areas throughout cismontane California. White-tailed kites typically nest in dense vegetation at the tops of oaks, willows, or other native trees. They prey primarily on voles and other diurnal mammals (CDFG, 2005). Their numbers and range have increased in the past few decades (CDFG, 2005).

There are two known CNDDB occurrences of white-tailed kite in the survey area, the most recent documented in 2009. The survey area provides trees suitable for nesting and potential foraging habitat is available along the levees and in nearby parks and open grasslands. White-tailed kites were not observed during the surveys.

Other Breeding and Migratory Birds

The Federal Migratory Bird Treaty Act and California Fish and Game Code protect raptors, most native migratory birds, and breeding birds that could be present in the survey area. The LAR parkway corridor provides high-quality foraging and nesting opportunities for a variety of resident and migratory birds. Common raptor species that may nest in the mature trees of the parkway could include red-tailed hawk, red-shouldered hawk (observed), and great horned owl. Wading birds such as the great egret and the great blue heron are known to nest upstream and downstream of the survey area, and have been observed foraging in the survey area. Among the many passerine species observed in the survey area and with the potential to nest are western scrub jay, acorn woodpecker, downy woodpecker, northern flicker, black phoebe, American robin, western bluebird, and ash-throated flycatcher. Cliff swallows were observed nesting under the Howe Avenue Bridge. Purple martin, a California species of special concern, is also known to occur in the area and has the potential to nest in the survey area. A full list of species observed in the survey area is provided in Appendix B, Table B-1.

Pallid Bat

The pallid bat, a California species of special concern, occurs throughout California except in parts of the high Sierra and the northwestern corner of the state (Zeiner et al., 1990b). The pallid bat inhabits a variety of habitats, such as grasslands, shrublands, woodlands, and forests; however, it is most abundant in open, dry habitats with rocky areas for roosting. Pallid bats roost alone, in small groups, or gregariously (WBWG, 2005). Roosts include caves, crevices in rocky outcrops and cliffs, mines, trees, and various manmade structures (e.g., bridges, barns, porches); they generally have unobstructed entrances/exits and are high above the ground, warm, and inaccessible to terrestrial predators. Year-to-year and night-to-night roost reuse is common; however, bats may switch day roosts on a daily and seasonal basis (WBWG, 2005).

The pallid bat is the most widely described special-status bat species in central California. No occurrences are reported within five miles of the survey area, or within the nine-quadrangle area that includes the survey area. However, during reconnaissance-level surveys, bats were observed using the H Street Bridge for a day roost. The bats were not identified to species, but the bridge may provide suitable roosting habitat for this species.

Western Red Bat

The western red bat is a California species of special concern. This is a riparian obligate species (i.e., dependent on riparian habitat) that is ubiquitous throughout California except the northern Great Basin region. Western red bats roost individually in dense clumps of tree foliage in riparian areas, orchards, and suburban areas. They are primarily moth specialists, but will forage for a variety of other insects. Individuals have been observed foraging around street lamps and floodlights in suburban areas (WBWG, 2005).

Based on its tendency to roost within tree foliage, this species may be intermittently present in the riparian and woodland habitat in the survey area; however, roosting occurrences are not reported by the CNDDB within five miles of the survey area or within the nine-quadrangle area that includes the survey area.

American Badger

The American badger is a California species of special concern. This species prefers open grasslands and riparian habitat within the valley areas, although it occurs throughout multiple habitat types in California. The principal requirements seem to be sufficient food, friable soils to excavate dens and pursue prey, and relatively open, uncultivated ground. In California, badgers range throughout the state, except for the humid coastal forests of northwestern California in Del Norte County and the northwestern portion of Humboldt County (Williams, 1986).

Reconnaissance-level wildlife surveys of the survey area in summer did not detect any badger excavations or other signs of species presence. This species was previously observed in the vicinity of the survey area (two miles to the south), but the observation is almost 30 years old. Nonetheless, suitable habitat occurs in the survey area in annual grasslands.

Critical Habitat for Listed Wildlife Species

USFWS defines the term “critical habitat” in the Federal Endangered Species Act as a specific geographic area(s) that contains features essential for the conservation of a threatened or endangered species and that may require special management and protection. The survey area is not within designated critical habitat for any listed terrestrial wildlife species.

Natural Communities Crosswalk

TABLE A-1
CROSSWALK TABLE OF NATURAL COMMUNITIES

Natural Community	CWHR	Manual of California Vegetation Alliance
Annual grassland	Annual grassland	Annual brome grassland
		Yellow star-thistle fields
		Western ragweed meadow
		Wild oats grassland
		Poison hemlock or fennel patch
Oak woodland	Coastal oak woodland	Coast live oak woodland
	Valley oak woodland	Valley oak woodland
		Hind's walnut and related stand
	Montane hardwood	Interior live oak woodland
Upland scrub	Coastal scrub	Coyote brush scrub
	Valley foothill riparian	California rose briar patch
		Coastal bramble
		Blue elderberry stand
Non-native woodland	Eucalyptus	Eucalyptus–tree of heaven–black locust grove
Riparian woodland	Valley foothill riparian	Fremont cottonwood forest
		Box-elder forest
		Red willow thicket
		Black willow thicket
		White alder grove
		Valley oak woodland
		California sycamore woodland
		Oregon ash grove
Riparian scrub	Valley foothill riparian	Sandbar willow thicket
		Arroyo willow thicket
		Pacific willow thicket
		Button willow thicket
		Blue elderberry stand
		California rose briar patch

NOTES:

CWHR = California Wildlife Habitat Relationship System

* Areas dominated by non-native trees, and some native shrubs, do not conform to recognized *Manual of California Vegetation* alliances.

** Areas with remnant riparian species that no longer experience hydrologic influence are now considered upland habitat types.

Appendix B

Wildlife and Plant Species Observed during Reconnaissance Surveys

TABLE B-1
WILDLIFE SPECIES OBSERVED IN THE SURVEY AREA

COMMON NAME	SCIENTIFIC NAME
REPTILES	
western pond turtle	*Actinemys marmorata*
western fence lizard	*Sceloporus occidentalis*
red-eared slider	*Trachemys scripta elegans*
BIRDS	
red-shouldered hawk	*Accipiter striatus*
mallard	*Anas platyrhynchos*
western scrub-jay	*Aphelocoma californica*
great egret	*Ardea alba*
Canada goose	*Branta canadensis*
California quail	*Callipepla californica*
Anna's hummingbird	*Calypte anna*
house finch	*Carpodacus mexicanus*
turkey vulture	*Cathartes aura*
northern flicker	*Colaptes auratus*
rock dove	*Columba livia*
American crow	*Corvus brachyrhynchos*
dark-eyed junco	*Junco hyemalis*
belted kingfisher	*Megaceryle alcyon*
acorn woodpecker	*Melanerpes formicivorus*
wild turkey	*Meleagris gallopavo*
song sparrow	*Melospiza melodia*
California towhee	*Melozone crissalis*
common merganser	*Mergus merganser*
northern mockingbird	*Mimus polyglottos*
ash-throated flycatcher	*Myiarchus cinerascens*
cliff swallow	*Petrochelidon pyrrhonota*
Nuttall's woodpecker	*Picoides nuttallii*
spotted towhee	*Pipilo maculatus*
bushtit	*Psaltriparus minimus*
black phoebe	*Sayornis nigricans*
western bluebird	*Sialia mexicana*
lesser goldfinch	*Spinus psaltria*
European starling	*Sturnus vulgaris*
house wren	*Troglodytes aedon*
American robin	*Turdus migratorius*
mourning dove	*Zenaida macroura*

TABLE B-1
WILDLIFE SPECIES OBSERVED IN THE SURVEY AREA

COMMON NAME	SCIENTIFIC NAME
MAMMALS	
bat (unidentified to species)	unknown
coyote	*Canis latrans*
American beaver	*Castor canadensis*
black-tailed jackrabbit	*Lepus californicus*
black-tailed deer	*Odocoileus hemionus*
western gray squirrel	*Sciurus griseus*
brush rabbit	*Sylvilagus bachmani*

TABLE B-2
PLANT SPECIES OBSERVED IN THE SURVEY AREA

Scientific Name	Common Name	Family
Acer buergerianum	trident maple	Sapindaceae
Acer negundo	boxelder	Sapindaceae
Acer saccharinum	silver maple	Sapindaceae
Acmispon americanus	American bird's foot trefoil	Fabaceae
Aesculus californica	California buckeye	Sapindaceae
Agrostis avenacea	Pacific bentgrass	Poaceae
Agrostis stolonifera	creeping bentgrass	Poaceae
Ailanthus altissima	tree of heaven	Simaroubaceae
Alnus rhombifolia	white alder	Betulaceae
Amaranthus albus	tumbleweed	Amaranthaceae
Ambrosia psilostachya	ragweed	Asteraceae
Anthemis cotula	stinking chamomile	Asteraceae
Anthriscus caucalis	bur chervil	Apiaceae
Apocynum cannabinum	Indian hemp	Apocynaceae
Aristolochia californica	California pipe vine	Aristolochiaceae
Artemisia douglasiana	California mugwort	Asteraceae
Artemisia dracunculus	wild tarragon	Asteraceae
Avena barbata	slender oat	Poaceae
Baccharis pilularis ssp. *consanguinea*	coyote brush	Asteraceae
Baccharis salicifolia	mule fat	Asteraceae
Betula sp.	birch	Betulaceae
Bidens frondosa	sticktight	Asteraceae
Brassica nigra	black mustard	Brassicaceae
Brickellia californica	California brickellia	Asteraceae
Bromus catharticus	rescue grass	Poaceae

TABLE B-2
PLANT SPECIES OBSERVED IN THE SURVEY AREA

Scientific Name	Common Name	Family
Bromus diandrus	ripgut brome	Poaceae
Bromus hordeaceus	soft brome	Poaceae
Cardamine oligosperma	bitter cress	Brassicaceae
Carduus pycnocephalus	Italian thistle	Asteraceae
Carex barbarae	Santa Barbara sedge	Cyperaceae
Casuarina equisetifolia	Australian pine	Casuarinaceae
Catalpa bignonioides	Southern catalpa	Bignoniaceae
Celtis australis	European hackberry	Cannabaceae
Centaurea solstitialis	yellow star thistle	Asteraceae
Centromadia pungens ssp. *pungens*	common tarweed	Asteraceae
Cephalanthus occidentalis	common buttonbush	Rubiaceae
Cercis occidentalis	Western redbud	Fabaceae
Chenopodium album	lambs quarters	Chenopodiaceae
Chondrilla juncea	skeleton weed	Asteraceae
Cinnamomum camphora	camphortree	Lauraceae
Clarkia unguiculata	elegant clarkia	Onagraceae
Clematis lasiantha	pipestem	Ranunculaceae
Conium maculatum	poison hemlock	Apiaceae
Convolvulus arvensis	field bindweed	Convulvulaceae
Crassula aquatica	water pigmyweed	Crassulaceae
Croton setiger	turkey-mullein	Euphorbiaceae
Cuscuta subinclusa	canyon dodder	Convulvulaceae
Cynodon dactylon	Bermuda grass	Poaceae
Cynosurus echinatus	dogtail grass	Poaceae
Cyperus eragrostis	tall flatsedge	Cyperaceae
Cyperus esculentus	yellow nutgrass	Cyperaceae
Datura wrightii	jimsonweed	Solanaceae
Daucus carota	wild carrot	Apiaceae
Digitaria sanguinalis	hairy crabgrass	Poaceae
Dittrichia graveolens	stinkwort	Asteraceae
Dysphania ambrosioides	Mexican tea	Chenopodiaceae
Egeria densa	brazilian waterweed	Hydrocharitaceae
Elymus triticoides	beardless wildrye	Poaceae
Epilobium brachycarpum	annual fireweed	Onagraceae
Epilobium ciliatum	slender willow herb	Onagraceae
Equisetum arvense	common horsetail	Equisetaceae
Equisetum hymale ssp. affine	common scouring rush	Equisetaceae
Erigeron canadensis	Canada horseweed	Asteraceae
Erodium botrys	long-beaked filaree	Geraniaceae

TABLE B-2
PLANT SPECIES OBSERVED IN THE SURVEY AREA

Scientific Name	Common Name	Family
Erodium cicutarium	red-stemmed filaree	Geraniaceae
Erodium moschatum	white-stemmed filaree	Geraniaceae
Erythranthe guttata	yellow monkey flower	Phrymaceae
Eschscholzia californica	California poppy	Papaveraceae
Eucalyptus camaldulensis	red river gum	Myrtaceae
Euphorbia maculata	spotted spurge	Euphorbiaceae
Euphorbia peplus	petty spruge	Euphorbiaceae
Festuca myuros	rattail sixweeks grass	Poaceae
Foeniculum vulgare	fennel	Apiaceae
Fraxinus latifolia	Oregon ash	Oleaceae
Fraxinus veluntina	Arizona ash	Oleaceae
Galium aparine	stickywilly	Rubiaceae
Galium murale	tiny bedstraw	Rubiaceae
Galium parisiense	wall bedstraw	Rubiaceae
Geranium dissectum	cutleaf geranium	Geraniaceae
Hedera helix	English ivy	Araliaceae
Helminthotheca echioides	bristly ox-tongue	Asteraceae
Heterotheca grandiflora	telegraph weed	Asteraceae
Heterotheca oregana	Oregon golden aster	Asteraceae
Hirschfeldia incana	wild mustard	Brassicaceae
Hordeum marinum	seaside barley	Poaceae
Hordeum murinum	foxtail barley	Poaceae
Hydrocotyle verticillata	whorled marsh pennywort	Araliaceae
Hypericum perforatum	Klamath weed	Hypericaceae
Iris pseudacorus	water iris	Iridaceae
Isolepis cernua	low bulrush	Cyperaceae
Juglans californica	Southern California black walnut	Juglandaceae
Juglans hindsii	Northern California black walnut	Juglandaceae
Juncus balticus	baltic rush	Juncaceae
Juncus bufonius	toad rush	Juncaceae
Juncus effusus ssp. *pacificus*	Pacific rush	Juncaceae
Juncus patens	spreading rush	Juncaceae
Kickxia elatine	sharp-leaved fluellin	Plantaginaceae
Lactuca serriola	prickly lettuce	Asteraceae
Lathyrus jepsonii var. *californicus*	California tule pea	Fabaceae
Leersia oryzoides	rice cutgrass	Poaceae
Lepidium didymum	lesser swine cress	Brassicaceae
Lepidium latifolium	perennial pepperweed	Brassicaceae
Ligustrum japonicum	Japanese privet	Oleaceae

TABLE B-2
PLANT SPECIES OBSERVED IN THE SURVEY AREA

Scientific Name	Common Name	Family
Lindernia dubia	yellowseed false pimpernel	Plantaginaceae
Liquidambar styraciflua	sweetgum	Hamamelidaceae
Logfia gallica	narrowleaf cottonrose	Asteraceae
Ludwigia hexapetala	ludwigia	Onagraceae
Lysimachia arvensis	scarlet pimpernel	Myrsinaceae
Lythrum hyssopifolia	hyssop loosestrife	Lythraceae
Madia elegans	common madia	Asteraceae
Malva neglecta	common mallow	Malvaceae
Marah fabacea	California man-root	Cucurbitaceaev
Marrubium vulgare	white horehound	Lamiaceae
Medicago polymorpha	bur clover	Fabaceae
Melilotus albus	white sweet clover	Fabaceae
Melilotus indicus	annual yellow sweet clover	Fabaceae
Mentha pulegium	pennyroyal	Lamiaceae
Morus alba	white mulberry	Moraceae
Myriophyllum aquatica	parrot's feather	Haloragaceae
Nerium oleander	oleander	Apocynaceae
Nicotiana acuminata var. *multiflora*	may flowered tobacco	Solanaceae
Nicotiana glauca	tree tobacco	Solanaceae
Oenothera elata	evening primrose	Onagraceae
Olea europaea	olive	Oleaceae
Oxalis radicosa	dwarf woodsorrel	Oxalidaceae
Paspalum dilatatum	dallis grass	Poaceae
Paspalum distichum	knot grass	Poaceae
Paspalum urvillei	Vasey's grass	Poaceae
Persicaria punctata	dotted smartweek	Polygonaceae
Petrorhagia dubia	Windmill pink	Caryophyllaceae
Phoradendron leucarpum	mistletoe	Viscaceae
Phyla nodiflora	common lippia	Verbenaceae
Phytolacca americana	American pokeweed	Phytolaccaceae
Pistacia chinensis	Chinese pistachio	Anacardiaceae
Plantago lanceolata	narrow leaved plantain	Plantaginaceae
Platanus racemosa	California sycamore	Platanaceae
Platanusx hispanica	London plane tree	Platanaceae
Poa annua	annual blue grass	Poaceae
Polycarpon tetraphyllum var. *tetraphyllum*	four leaved allseed	Caryophyllaceae
Polygonum aviculare	prostrate knotweed	Polygonaceae
Polypogon monspeliensis	rabbitsfoot grass	Poaceae
Portulaca oleracea	common purslane	Portulacaceae

TABLE B-2
PLANT SPECIES OBSERVED IN THE SURVEY AREA

Scientific Name	Common Name	Family
Potamogeton crispus	curly pondweed	Potamogetonaceae
Prunus cerasifera	cherry plum	Rosaceae
Prunus dulcis	domestic almond	Rosaceae
Pseudognaphalium beneolens	cudweed	Asteraceae
Pseudognaphalium luteoalbum	Jersey cudweed	Asteraceae
Pseudognaphalium stramineum	cottonbatting plant	Asteraceae
Quercus agrifolia	coast live oak	Fagaceae
Quercus chrysolepis	canyon live oak	Fagaceae
Quercus ilex	holly oak	Fagaceae
Quercus kelloggii	black oak	Fagaceae
Quercus lobata	valley oak	Fagaceae
Quercus suber	cork oak	Fagaceae
Quercus wislizeni	Interior live oak	Fagaceae
Raphanus sativus	wild radish	Brassicaceae
Robinia pseudoacacia	black locust	Fabaceae
Rorippa curvisiliqua	curvepod yellow cress	Brassicaceae
Rosa californica	California wild rose	Rosaceae
Rubus armeniacus	Himalayan blackberry	Rosaceae
Rubus ursinus	California blackberry	Rosaceae
Rumex conglomeratus	Clustered dock	Polygonaceae
Rumex crispus	curly dock	Polygonaceae
Rumex stenophyllus	narrowleaf dock	Polygonaceae
Salix laevigata	red willow	Salicaceae
Salix lasiandra	Pacific willow	Salicaceae
Salix lasiolepis	arroyo willow	Salicaceae
Salsola tragus	prickly russian thistle	Chenopodiaceae
Sambucus nigra ssp. *caerulea*	blue elderberry	Adoxaceae
Saponaria officinalis	bouncing bet	Caryophyllaceae
Senecio vulgaris	common groundsel	Asteraceae
Sesbania punicea	red sesbania	Fabaceae
Setaria parviflora	marsh bristlegrass	Poaceae
Silybum marianum	milk thistle	Asteraceae
Solanum americanum	white nightshade	Solanaceae
Solanum elaeagnifolium	silver leaved horsenettle	Solanaceae
Sonchus asper	spiny sowthistle	Asteraceae
Sonchus oleraceus	common sow thistle	Asteraceae
Sorghum halepense	Johnsongrass	Poaceae
Spergularia bocconi	Boccone's sand spurry	Caryophyllaceae
Spergularia rubra	purple sand spurry	Caryophyllaceae

TABLE B-2
PLANT SPECIES OBSERVED IN THE SURVEY AREA

Scientific Name	Common Name	Family
Stipa pulchra	purple needle grass	Poaceae
Symphoricarpos albus	common snowberry	Caprifoliaceae
Teraxacum officinale	common dandelion	Asteraceae
Torilis arvensis	field hedge parsley	Apiaceae
Triadica sebifera	Chinese tallowtree	Euphorbiaceae
Tribulus terrestris	puncture vine	Zygophyllaceae
Trifolium hirtum	rose clover	Fabaceae
Trifolium repens	white clover	Fabaceae
Typha latifolia	broadleaf cattail	Typhaceae
Ulmus americana	American elm	Ulmaceae
Ulmus minor	English elm	Ulmaceae
Ulmus parviflora	Chinese elm	Ulmaceae
Ulmus pumila	Siberian elm	Ulmaceae
Umbellularia californica	California bay	Lauraceae
Urtica dioica	stinging nettle	Urticaeae
Verbascum blattaria	moth mullein	Scrophulariaceae
Verbascum thapsus	woolly mullein	Scrophulariaceae
Verbena litoralis	seashore vervain	Verbenaceae
Veronica peregrina ssp. *xalapensis*	purslane speedwell	Plantaginaceae
Vicia villosa	hairy vetch	Fabaceae
Vinca major	bigleaf periwinkle	Apocynaceae
Viola odorata	English violet	Violaceae
Vitis californica	California wild grape	Vitaceae
Xanthium strumarium	rough cockleburr	Asteraceae
Zeltnera muehlenbergii	Meuhlenberg's centaury	Gentianaceae

OUR COMMITMENT TO SUSTAINABILITY | ESA helps a variety of public and private sector clients plan and prepare for climate change and emerging regulations that limit GHG emissions. ESA is a registered assessor with the California Climate Action Registry, a Climate Leader, and founding reporter for the Climate Registry. ESA is also a corporate member of the U.S. Green Building Council and the Business Council on Climate Change (BC3). Internally, ESA has adopted a Sustainability Vision and Policy Statement and a plan to reduce waste and energy within our operations. This document was produced using recycled paper.

CHAPTER 1
Introduction and Summary

1.1 Introduction

This report documents the results of special-status plant surveys conducted in July 2019 for the American River Common Features 2016 Project, American River Contract 1. Environmental Science Associates (ESA) conducted the surveys on behalf of the U.S. Army Corps of Engineers, Central Valley Flood Protection Board, and Sacramento Area Flood Control Agency. The objective of the surveys was to locate and document any special-status plants in the survey area.

1.2 Summary of Results

Four Sanford's arrowhead (*Sagittaria sanfordii*) plants were observed in the survey area. Sanford's arrowhead is a California Rare Plant Rank (CRPR) 1B.2 species. No other special-status plants were observed.

This page intentionally left blank

CHAPTER 2
Methodology

2.1 Survey Area

The survey area is in northwestern Sacramento County, California, within the Sacramento city limits (**Figures 1** and **2**). The survey area totals 134.12 acres, encompassing the project footprint along the Lower American River plus a 20-foot buffer around the project perimeter. It extends from Paradise Bend at approximately river mile 5.4, near the City of Sacramento's Glenn Hall Park, upstream along the American River to just past the Howe Avenue Bridge at approximately river mile 7.9.

The survey area is mostly within the American River Parkway and includes several paved, gravel, and dirt trails. It includes all or portions of the Campus Commons Golf Course, the H Street Bridge, the Guy West Bridge, the Howe Avenue Bridge, and University Park.

The survey area falls within Sections 3, 10, and 11 (Township 8 North, Range 5 East) of the Sacramento East, California U.S. Geological Survey 7.5-minute series quadrangle. The approximate centroid of the survey area is 38.567864º North, 121.422750º West. Elevations range from approximately 17 feet to 47 feet above mean sea level.

Ecologically, the survey area is located within the Great Central Valley subregion of the California Floristic Province (Baldwin et al., 2012). Regional natural plant communities typical of the Central Valley are grassland, mixed oak woodland, upland scrub, riparian woodland, and riparian scrub. Most of the area surrounding the survey area is urbanized.

2.2 Background Research

Before conducting the field surveys, ESA compiled a list of special-status plants that occur or may occur in the vicinity of the survey area and for which suitable habitat may be present in the survey area (**Appendix A**). Data sources consulted included the California Natural Diversity Database (CDFW, 2019); the U.S. Fish and Wildlife Service IPaC Trust Resources Report (USFWS, 2019); and the California Native Plant Society (CNPS) Inventory of Rare and Endangered Plants (CNPS, 2019).

The list compiled includes 21 special-status plants with potential to occur in the regional project vicinity (**Appendix A**). Each species' habitat requirements were compared to available habitats in the survey area to determine the special-status plants with potential to occur in the survey area.

2.3 Field Survey and Follow-Up Visit

The field survey was conducted by ESA botanists Chuck Hughes and Joseph Sanders on July 9, 2019. A follow-up visit was conducted by Chuck Hughes and ESA biologist Emily Dorrance on July 24, 2019. Surveys followed the procedures described in the California Department of Fish and Wildlife (CDFW) *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities* (CDFW, 2018a) and the U.S. Fish and Wildlife Service *Guidelines for Conducting and Reporting Botanical Inventories for Federally Listed, Proposed and Candidate Plants* (USFWS, 1996).

The surveys were floristic in nature: Every plant taxon found in the survey area was identified to the taxonomic level necessary to determine its rarity and listing status. Botanical taxonomy and nomenclature conform to *The Jepson Manual: Vascular Plants of California,* second edition (Baldwin et al., 2012) as revised by the Jepson eFlora (Jepson Flora Project, 2019).

Conditions at the time of the surveys were typical for summer in western Sacramento County (warm to hot and dry). The timing of the surveys corresponded to the flowering season for all species with at least moderate potential to occur in the survey area based on background research. The survey area was searched systematically using transects spaced about 50 feet apart where vegetation allowed. Frequent deviations were made to thoroughly search areas deemed more suitable for special-status plants, to identify additional plant species, or to go around impenetrable vegetation. Any observed special-status plants were mapped in the field with a global positioning system (GPS). Data were collected on a custom ArcCollector map using an iPad connected to a Trimble R-1, an external, submeter-accuracy GPS receiver.

CHAPTER 3
Setting

3.1 Climate

The survey area's climate is Mediterranean, characterized by warm, dry summers and cool, wet winters. The bulk of precipitation occurs as rain in the winter months. Sacramento's mean annual precipitation is 20.27 inches and temperatures range from a mean annual maximum of 73.1 degrees Fahrenheit to an average minimum temperature of 49.8 degrees Fahrenheit. Precipitation from July 1, 2018, through June 30, 2019, totaled 26.11 inches, 129 percent of average annual rainfall (NWSFO, 2019); the previous winter was wetter than normal. The survey area was experiencing normal dry summertime conditions during the field survey.

3.2 Soils

The U.S. Department of Agriculture, Natural Resources Conservation Service Web Soil Survey was consulted to determine the soil units occurring in the survey area. The *Custom Soil Resource Report for Sacramento County, California – American River Common Features, American River Contract 1: Special-Status Plant Survey* (NRCS, 2019; included as **Appendix B** to this report) shows five map units in the survey area. See Appendix B for a soils map and soil unit descriptions.

3.3 Natural Communities

Natural communities are assemblages of plant species that occur together in the same area, and are defined by species composition and relative abundance. In summer 2018, vegetation was mapped by ESA to an alliance level based on the dominant plant species and in accordance with the membership rules described in the *Manual of California Vegetation* (Sawyer et al. 2009). As described below, these alliances were then grouped into broader natural communities to more closely conform with the CDFW natural communities, which comply with the National Vegetation Classification Standard. **Appendix C** presents a list of plant species observed and **Figures 3a through 3c** depict the natural communities.

California Annual Grassland

Grasslands can be found throughout the survey area, typically in upland areas, and consist mainly of non-native grasses and forbs. Most of the grassland habitat is interspersed amongst woodland and other habitats and present adjacent to urban areas. Annual grasslands on levee slopes are mowed regularly.

Common grass species observed in this community include wild oat (*Avena barbata*), bromes (*Bromus diandrus, B. hordeaceus*), foxtail barley (*Hordeum murinum*), rattail sixweeks grass (*Festuca myuros*), Bermuda grass (*Cynodon dactylon*), and Pacific bentgrass (*Agrostis avenacea*). Pockets of native grasses such as beardless wild rye (*Elymus triticoides*) and purple needle grass (*Stipa pulchra*) occur sporadically throughout the grasslands in the survey area and may have been seeded on the levee slopes.

An assemblage of native and non-native forbs also occurs in these grasslands. Among the many common non-native forbs observed are hairy vetch (*Vicia villosa*), cutleaf geranium (*Geranium dissectum*), Italian thistle (*Carduus pycnocephalus*), yellow star thistle (*Centaurea solstitialis*), prickly lettuce (*Lactuca serriola*), poison hemlock (*Conium maculatum*), wild radish (*Raphanus sativus*), wild mustard (*Hirschfeldia incana*), rose clover (*Trifolium hirtum*), and white sweet clover (*Melilotus indicus*). Some common native forbs observed include Canada horseweed (*Erigeron canadensis*), telegraph weed (*Heterotheca grandiflora*), ragweed (*Ambrosia psilostachya*), elegant clarkia (*Clarkia unguiculata*), and turkey-mullein (*Croton setiger*).

Annual grassland dominated by bromes (CDFW Natural Community Code = 42.026.00) or wild oat (44.150.00) is not considered a sensitive natural community by CDFW (2018b).

Mixed Oak Woodland

Oak woodlands in the survey area are dominated by coast live oak (*Quercus agrifolia*) and valley oak (*Q. lobata*); interior live oak (*Q. wislizeni*) and Northern California black walnut (*Juglans hindsii*) are less frequent contributors to the tree canopy.

Oak woodlands in the survey area support a variety of understory plant species, vegetative structures, and densities. When no shrub layer is present, annual grassland is the dominant understory and includes the common species described above for the California annual grassland community. When a shrub layer is present, common native shrubs observed include California rose (*Rosa californica*), California blackberry (*Rubus ursinus*), blue elderberry (*Sambucus nigra* ssp. *caerulea*), and coyote brush (*Baccharis pilularis* ssp. *consanguinea*). Himalayan blackberry (*Rubus armeniacus*) was the only common non-native shrub observed in the understory of oak woodlands.

Oak woodlands co-dominated by coast live oak and valley oak (71.040.06) are considered a sensitive natural community by CDFW (2018b).

Non-native Woodland

Portions of the survey area are dominated by non-native trees. These single-species tree stands consist of either Australian pine (*Casuarina equisetifolia*), black locust (*Robinia pseudoacacia*), or tree of heaven (*Ailanthus altissima*). With the exception of black locust stands, non-native woodlands in the survey area do not support a shrub understory, and are dominated by the common herbaceous species described above for California annual grassland. Some black locust stands support blue elderberry shrubs in the understory.

Woodlands dominated by non-native trees are not considered a sensitive natural community by CDFW (2018b).

Upland Scrub

Upland scrub habitat in the survey area consists of areas dominated by native and non-native shrubs that have no tree cover and contain the common herbaceous species described above for California annual grassland. The most common native shrub species in this community are coyote brush, California blackberry, and Himalayan blackberry. Other woody species present include blue elderberry, California rose, California grape (*Vitis californica*), and western redbud (*Cercis occidentalis*).

Scrub dominated by coyote brush and blackberry (32.060.15) is not considered a sensitive natural community by CDFW (2018b).

Riparian Scrub

Riparian scrub habitat in the survey area consists of shrub-dominated areas that are subject to hydrologic influence from the Lower American River. These areas are dominated by sandbar willow (*Salix exigua*), arroyo willow (*S. lasiolepis*), common button bush (*Cephalanthus occidentalis*), California rose, California blackberry, California wild grape, blue elderberry, and/or Himalayan blackberry. Areas that experience frequent high flows typically do not support herb species, and cobbles tend to be the dominant ground cover. Areas that experience less frequent, slower flows support a variety of herb species including mugwort (*Artemisia douglasiana*), marsh brittlegrass (*Setaria parviflora*), Santa Barbara sedge (*Carex barbarae*), horsetails (*Equisetum arvense* and *E. hyemale* ssp. *affine*), rushes (*Juncus balticus*, *J. effusus*, and *J. patens*), and beardless wildrye (*Elymus triticoides*).

Riparian scrub dominated by sandbar willow and arroyo willow (61.209.07) is not considered a sensitive natural community by CDFW (2018b). However, riparian areas are potentially subject to the provisions of Section 1600 of the California Fish and Game Code.

Riparian Woodland

Riparian woodlands in the survey area are tree-dominated areas that are subject to hydrologic influence from the Lower American River. These areas are dominated by Fremont cottonwood (*Populus fremontii*), Goodding's willow (*Salix gooddingii*), red willow (*S. laevigata*), white alder (*Alnus rhombifolia*), Oregon ash (*Fraxinus latifolia*), and/or California sycamore (*Platanus racemosa*). Arroyo willow, valley oak, American elm (*Ulmus americana*), and black locust are less frequent contributors to the tree canopy. Riparian woodlands support a variety of shrubs and herbs similar to those described above for the riparian scrub community.

Riparian woodland dominated by Fremont cottonwood and other riparian trees (61.130.00) is considered a sensitive natural community by CDFW (2018b).

Irrigated Turf

The Campus Commons Golf Course and University Park contain irrigated lawns that are mowed regularly and are dominated by Bermuda grass. Irrigated turf is not considered a sensitive natural community.

Riverine

Riverine habitat consists of areas inundated by the Lower American River. Such areas support some submerged or floating aquatic vegetation: Brazilian waterweed (*Egeria densa*), curly pondweed (*Potamogeton crispus*), and water primrose (*Ludwigia hexapetala*). The Lower American River is an aquatic resource subject to Sections 404 and 401 of the Clean Water Act and Section 1600 of the California Fish and Game Code.

Disturbed/Developed

Urban/developed habitat is present in unvegetated portions of the survey area. Paved, gravel, and dirt bike and walking paths and three bridges dissect the survey area. Disturbed/developed habitat is not a sensitive natural community.

CHAPTER 4
Results and Discussion

4.1 Special-Status Plant Species

For the purpose of this report, "special-status plants" include those species, subspecies, and varieties afforded legal protection under the California and/or Federal Endangered Species Acts or that are considered sufficiently rare by the scientific community to potentially qualify for such listing. Special-status plants include plants that fall into one or more of the following categories:

1. Plants listed or proposed for listing as threatened or endangered under the Federal Endangered Species Act (Code of Federal Regulations Title 50, Section 17.12).
2. Plants that are candidates for possible future listing as threatened or endangered under the Federal Endangered Species Act (*Federal Register* Volume 61, No. 40, February 28, 1996).
3. Plants listed or proposed for listing by the State of California as threatened or endangered under the California Endangered Species Act (California Code of Regulations Title 14, Section 670.5).
4. Plants listed as rare or endangered under the California Native Plant Protection Act (California Fish and Game Code, Section 1900 et seq.).
5. Plants that meet the definitions of rare and endangered under the California Environmental Quality Act (CEQA). CEQA Section 15380 provides that a plant or animal species may be treated as "rare or endangered" even if not on one of the official lists (State CEQA Guidelines, Section 15380).
6. Plants considered by the CNPS and CDFW to be "rare, threatened or endangered in California" (CRPR 1A, 1B, and 2 in CNPS, 2019) and CNPS Rank 3 and 4[1] plant species.

4.2 Special-Status Plants in the Study Area

As discussed below, Sanford's arrowhead was observed in the survey area during the ESA special-status plant surveys conducted in July 2019. **Figure 4** shows the location of the occurrence.

[1] CRPR 3 and 4 plants may be analyzed under CEQA Section 15380 if sufficient information is available to assess potential impacts on such plants. Factors such as regional rarity versus statewide rarity should be considered in determining whether cumulative impacts on a CRPR 3 or 4 plant are significant even if individual project impacts are not. CRPR 3 and 4 plants may be considered regionally significant if, for example, the occurrence is located at the periphery of the species' range, or exhibits unusual morphology, or occurs in an unusual habitat/substrate. For these reasons, CRPR 3 and 4 plants should be included in the special-status species analysis. CRPR 3 and 4 plants are also included in the California Natural Diversity Database's Special Plants, Bryophytes, and Lichens List. (See the current online published list at http://www.dfg.ca.gov/biogeodata.)

Sanford's Arrowhead

Description

Sanford's arrowhead (*Sagittaria sanfordii*) (CRPR 1B.2) is an aquatic emergent herb and a member of the Alismataceae family. It grows from a perennial underground tuber. This plant has both aquatic and emergent leaves, each with different morphology. The roots of the *Sagittaria* genus are septate, unlike other Alismataceae genera in California. The species is monoecious, with individuals bearing separate male and female flowers on the same inflorescence. It flowers between May and October. Growth of emergent leaves, and flowering, begins when waters start to recede. Sanford's arrowhead can be distinguished from most other Sagittaria taxa by its linear to lanceolate (non-sagittate) emergent leaves, and by its recurved fruit pedicels. It grows in freshwater ponds, ditches, swamps, and other assorted shallow freshwater habitats from 0 to 650 meters.

Survey Results

Four individual plants determined to potentially be Sanford's arrowhead were observed during the survey on July 9, 2019. The plants were growing within a few square feet of each other in about 4 inches of water, in an area of mud substrate. Observed plant associates include ludwigia (*Ludwigia hexapetala*), whorled marsh pennywort (*Hydrocotyle verticulata*), and water iris (*Iris pseudacorus*). Three of the Sanford's arrowhead plants had only aquatic leaves (**Appendix D,** Photo 1). The fourth plant was just beginning to develop emergent leaves. The emergent leaves were not sufficiently developed to determine whether they would be sagittate. A single root from the largest plant was dug out of the mud and was septate (Appendix D, Photo 2), indicating that the plant was not water plantain (*Alisma* sp.), which looks similar. The plants were located on the left (west) bank of the river at approximately river mile 5.9, adjacent to Site 2-1 (**Figure 4**).

On July 9, 2019, ESA botanists visited a reference population of Sanford's arrowhead (California Natural Diversity Database Occurrence #97) about 3.3 miles northwest of the survey area. Sanford's arrowhead plants were flowering at the location of the reference population, and were growing in much less water than in the survey area. Also in flower at the location of the reference population was lanceleaf water plantain (*Alisma lanceolatum*), a non-native plant with leaves similar to those of Sanford's arrowhead. When in flower, lanceleaf water plantain and Sanford's arrowhead are obviously different, but when only leaves (aquatic or emergent) are present, they appear similar. The roots of both species at the reference population location were compared to observe septation. Only the Sanford's arrowhead root was clearly septate (Appendix D, Photo 3).

During the first visit by ESA to the survey area, the emergent leaves on the largest plant were not developed enough to determine whether they would be sagittate. Sanford's arrowhead does not have sagittate leaves, unlike most other members of the genus. A follow-up visit was made on July 24, 2019. The largest plant had developed two mature emergent leaves by the time of the follow-up visit (Appendix D, Photos 4 and 5). The emergent leaves were lanceolate, not sagittate. The only other member of the genus in California with lanceolate leaves is *Sagittaria rigida*. All collections of *S. rigida* are either near Point Reyes or north of Red Bluff, far from the survey area. Based on the septate roots, the lanceolate leaves, and the comparison with the reference population, the four plants are most likely *Sagittaria sanfordii* (Sanford's arrowhead).

4.3 Discussion

Based on the appropriate timing of the surveys, above average precipitation during water year 2019, and the presence of target special-status plants in the survey area and at reference sites, no factors known to the investigators have affected the results of the survey. The survey results presented in this report are considered representative of the environmental setting, plant communities, and special-status plant populations in the survey area.

Appendix A
Database Queries

TABLE 1
SPECIAL-STATUS PLANTS WITH POTENTIAL TO OCCUR IN THE STUDY AREA

Scientific and Common Names	Status Federal/State/ CRPR or Other	Habitat Requirements	Potential Occurrence in Study Area
Astragalus tener var. *tener* Ferris' milk-vetch	--/--/1B.1	Vernally mesic meadows and seeps; sub alkaline grasslands. 1-60 meters. April - May	**Low.** Suitable alkaline substrate not present within the Study Area.
Brodiaea rosea subsp. *vallicola* valley brodiaea	--/--/4.2	Silty, sandy and gravelly loam soils; valley and foothill grasslands along swales; vernal pools. 10-335 meters. Grows in grasslands on old alluvial terraces that have developed a perched water table, in vernal pool landscapes (Preston 2013*). April - May (June)	**Low.** Vernal pool landscapes and hydrology not present.
Carex comosa bristly sedge	--/--/2B.1	Coastal prairie; margins of marshes and swamps; valley and foothill grassland. 0-625 meters. May - September	**Moderate.** Suitable habitat present.
Centromadia parryi subsp. *parryi* pappose tarplant	--/--/1B.2	Often on alkaline soils; chaparral; coastal prairie; meadows and seeps; coastal salt marshes and swaps; vernally mesic valley and foothill grassland. 0-420 meters. May - November	**Moderate.** Suitable habitat present.
Centromadia parryi subsp. *rudis* Parry's rough tarplant	--/--/4.2	Valley and foothill grassland on alkaline, vernally mesic soils; seeps; sometimes roadsides; vernal pools. 0-100 meters May - October	**Low.** Suitable soils not present.
Cuscuta obtusiflora var. *glandulosa* Peruvian dodder	--/--/2B.2	Freshwater marshes and swamps. 15-280 meters. July - October	**Low**. Suitable habitat present, but last seen in 1948 in Merced County. Observations in Sacramento County have not yet been verified.
Downingia pusilla dwarf downingia	--/--/2B.2	Mesic valley and foothill grassland; vernal pools; roadside ditches. 1-445 meters. March - May	**Low.** Suitable habitat not present.
Fritillaria agrestis stinkbells	--/--/4.2	Clay or sometimes serpentine soils; chaparral; cismontane woodland; pinyon and juniper woodland; valley foothill grassland. 10-1555 meters. March - June	**Low.** Suitable habitat on suitable soil is not present.
Gratiola heterosepala Boggs Lake hedge-hyssop	--/CE/1B.2	Clay soils; margins of marshes and swamps; vernal pools. 10-2375 meters. April – August	**Low.** Suitable habitat not present.
Hesperevax caulescens	--/--/4.2	Valley and foothill grassland on mesic, clay soils; vernal pools. 0-505 meters.	**Low.** Suitable habitat on suitable soil is not present.

TABLE 3 (CONTINUED)
SPECIAL-STATUS PLANTS WITH POTENTIAL TO OCCUR IN THE STUDY AREA

Scientific and Common Names	Status Federal/State/ CRPR or Other	Habitat Requirements	Potential Occurrence in Study Area
hogwallow starfish		March - June	
Hibiscus lasiocarpos var. *occidentalis* woolly rose-mallow	--/--/1B.2	Often in riprap on sides of levees; freshwater marshes and swamps. 0-120 meters. June - September	**Moderate.** Suitable habitat present.
Juglans hindsii Northern California black walnut		Deciduous tree found in riparian forests and riparian woodlands up to 460 meters. Widely naturalized as a result of agricultural use as a rootstock for English walnuts. Considered native and special-status in stands at three sites. April - May	**Low**. None of the special-status native stands are near the study area.
Juncus leiospermus var. *ahartii* Ahart's dwarf rush	--/--/1B.2	Vernal pools; mesic valley and foothill grassland. 30-229 meters. March - May	**Low.** Study area outside elevation range.
Legenere limosa legenere	--/--/1B.1	Vernal pools. 1-880 meters. April - June	**Low.** Suitable habitat not present.
Lepidium latipes var. *heckardii* Heckard's pepper-grass	--/--/1B.2	Alkaline flats within valley and foothill grassland. 2-200 meters. March - May	**Low.** Suitable soils not present.
Lilaeopsis masonii Mason's lilaeopsis	--/CR/1B.1	Freshwater or brackish marshes and swamps; riparian scrub. 0-10 meters June - September	**Low.** No occurrences this far upriver.
Navarretia eriocephala hoary navarretia	--/--/4.3	Vernally mesic cismontane woodland, and valley and foothill grassland. 105-400 meters. May – June	**Low.** Study area outside elevation range.
Packera layneae Layne's ragwort		Rocky serpentine or gabbroic soils in chaparral and cismontane woodland. 200 - 1,085 meters. April – August	**Low.** Suitable soils not present.
Sagittaria sanfordii Sanford's arrowhead	--/--/1B.2	Assorted shallow freshwater marshes and swamps. 0-650 meters. May – October (November)	**High.** Suitable habitat present and observed recently within 3 miles of study area.
Symphyotrichum lentum Suisun Marsh aster	--/--/1B.2	Brackish and freshwater marshes and swamps. 0-3 meters. (April) May - November	**Low.** Marginal suitable habitat present.
Trifolium hydrophilum saline clover	--/--/1B.2	Marshes and swamps; mesic, alkaline valley and foothill grassland; vernal pools. 0-300 meters April - June	**Low.** Suitable soils not present.

TABLE 3 (CONTINUED)
SPECIAL-STATUS PLANTS WITH POTENTIAL TO OCCUR IN THE STUDY AREA

Scientific and Common Names	Status Federal/State/ CRPR or Other	Habitat Requirements	Potential Occurrence in Study Area

NOTES:

Potential Occurrence in the Project area:
High = The project site and/or immediate project area provide ideal habitat conditions for a particular species and/or known populations occur in the immediate project area or within the project site.
Moderate = The project site and/or immediate project area provides suitable habitat for a particular species.
Low = The project site only provides limited and low quality habitat for a particular species. In addition, the known range for a particular species may be outside of the immediate project area.
Unlikely = The project site does not support suitable habitat for a particular species and/or the project site is outside of the species known range.

Status Codes:

Federal
FE = listed as endangered under the ESA
FT = listed as threatened under the ESA
-– = no listing

State
SE = listed as endangered under CESA
ST = listed as threatened under CESA

California Rare Plant Rank (CRPR)
Rank 1A = Plants presumed extirpated in California and either rare or extinct elsewhere.
Rank 1B = Plants rare, threatened, or endangered in California and elsewhere.
Rank 2A = Plants presumed extirpated in California, but more common elsewhere.
Rank 2B = Plants rare, threatened, or endangered in California, but more common elsewhere.

An extension reflecting the level of threat to each species is appended to each rarity category as follows:
.1 – Seriously endangered in California.
.2 – Fairly endangered in California.
.3 – Not very endangered in California.

Project Name: AMERICAN RIVER COMMON FEATURES PROJECT AMERICAN RIVER CONTRACT 1

Subject: List of threatened and endangered species that may occur in your proposed project location, and/or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, under the jurisdiction of the U.S. Fish and Wildlife Service (Service) that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the Service under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 et seq.).

Please follow the link below to see if your proposed project has the potential to affect other species or their habitats under the jurisdiction of the National Marine Fisheries Service:

http://www.nwr.noaa.gov/protected_species/species_list/species_lists.html

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the ECOS-IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the ECOS-IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 et seq.), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)(c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:

http://www.fws.gov/endangered/esa-library/pdf/TOC-GLOS.PDF

Please be aware that bald and golden eagles are protected under the Bald and Golden Eagle Protection Act (16 U.S.C. 668 et seq.), and projects affecting these species may require development of an eagle conservation plan (http://www.fws.gov/windenergy/eagle_guidance.html). Additionally, wind energy projects should follow the wind energy guidelines (http://www.fws.gov/windenergy/) for minimizing impacts to migratory birds and bats.

Guidance for minimizing impacts to migratory birds for projects including communications towers (e.g., cellular, digital television, radio, and emergency broadcast) can be found at: http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/towers.htm; http://www.towerkill.com; and http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/comtow.html.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Tracking Number in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

Endangered Species Act Species

There is a total of 7 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries[1], as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

Custom Soil Resource Report for Sacramento County, California

American River Common Features, American River Contract 1

August 2, 2019

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require

alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

How Soil Surveys Are Made

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

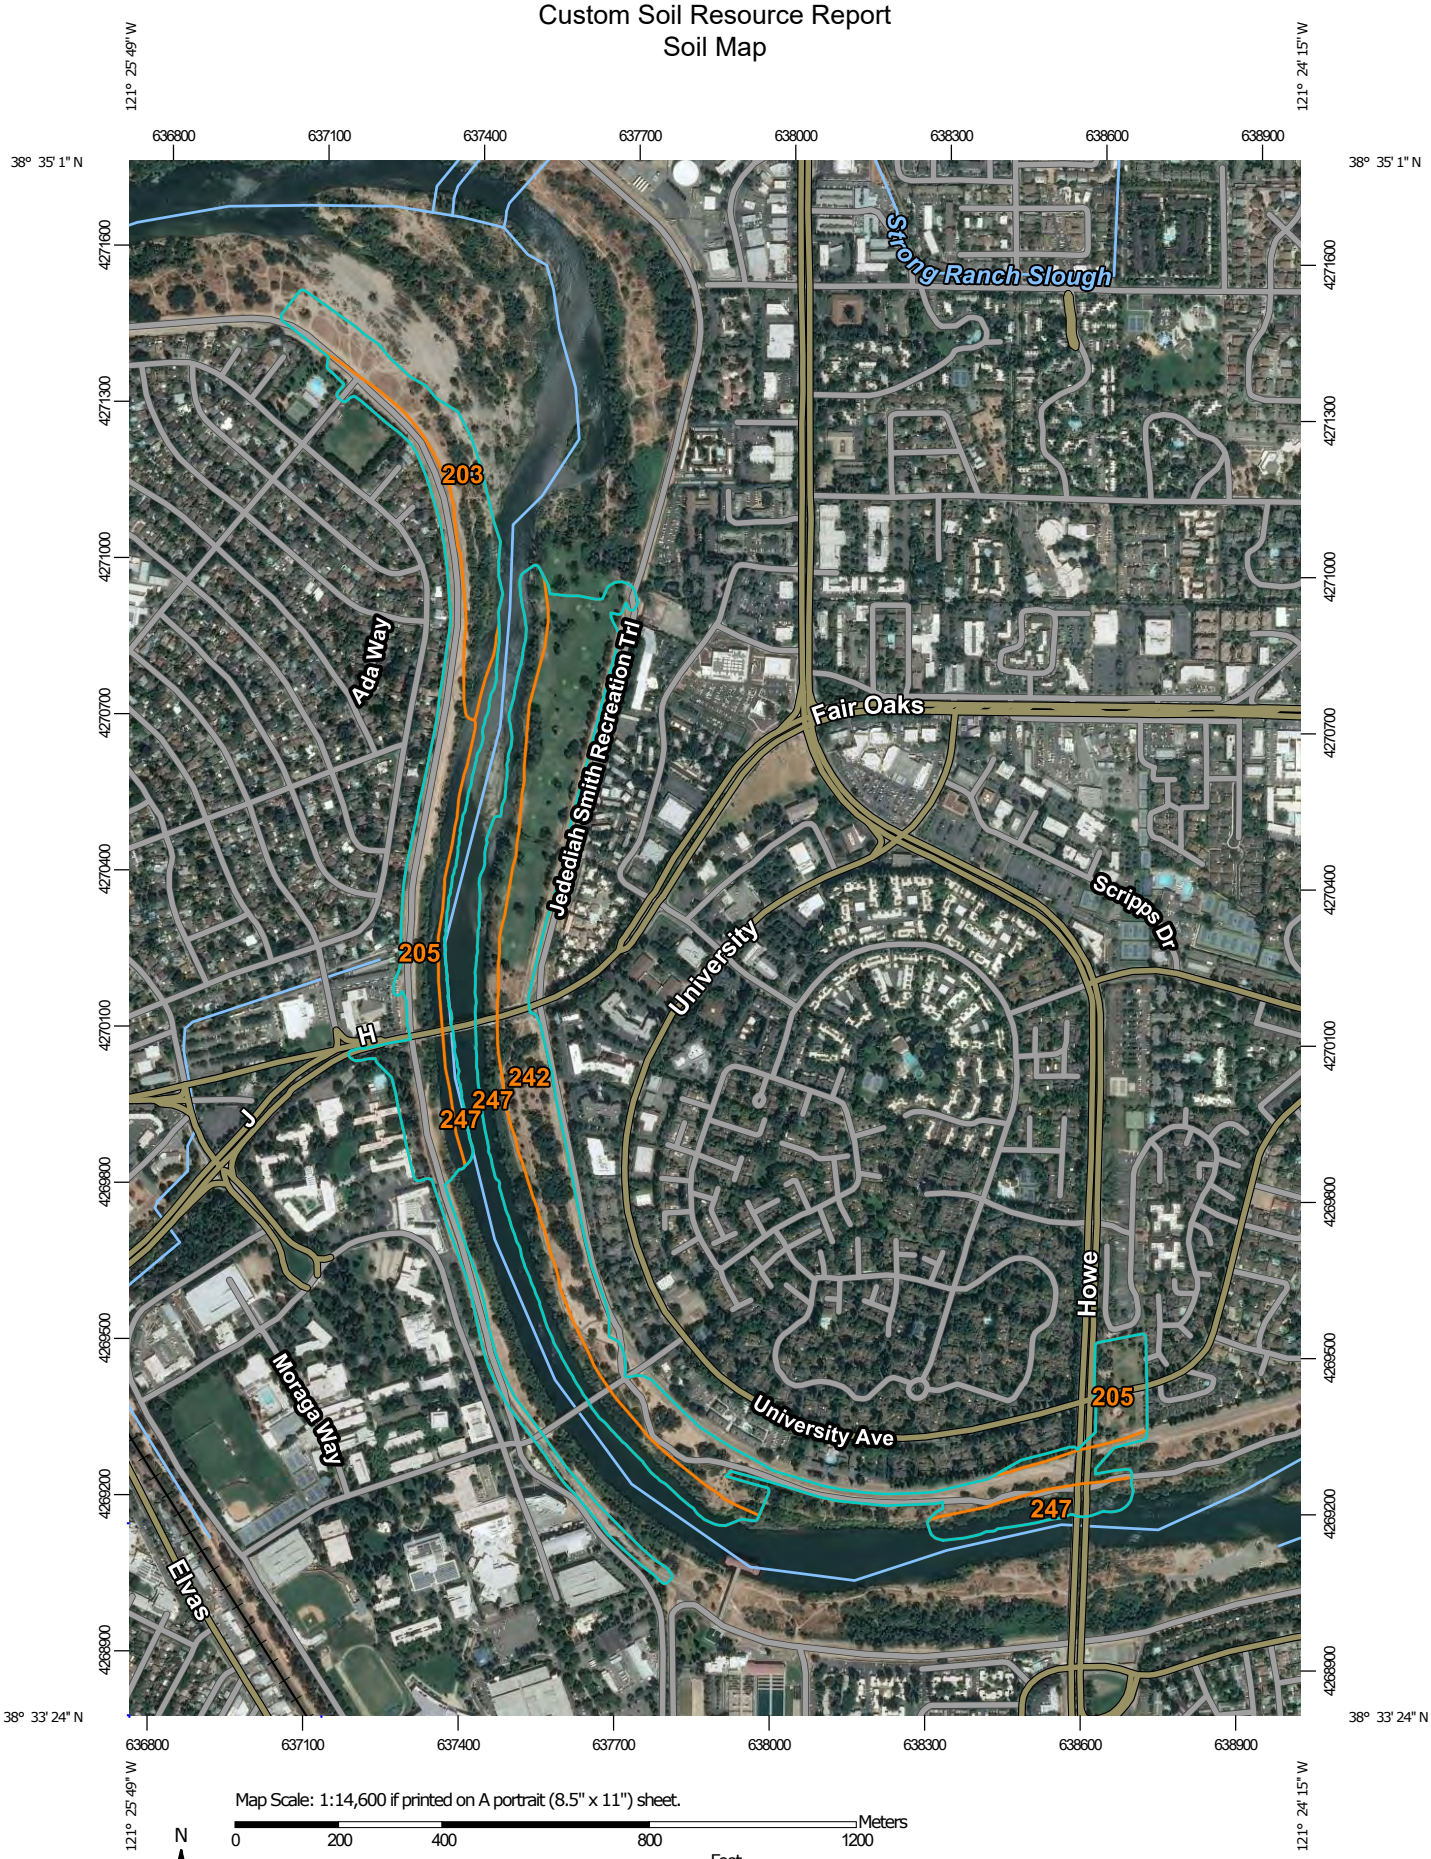
Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.



Map Scale: 1:14,600 if printed on A portrait (8.5" x 11") sheet.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Sacramento County, California
Survey Area Data: Version 17, Sep 14, 2018

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Aug 6, 2018—Aug 17, 2018

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
203	Riverwash	15.6	11.6%
205	Rossmoor-Urban land complex, 0 to 2 percent slopes	35.8	26.7%
242	Xerofluvents, 0 to 2 percent slopes, flooded	50.0	37.3%
247	Water	32.7	24.3%
Totals for Area of Interest		**134.1**	**100.0%**

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or

landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Sacramento County, California

203—Riverwash

Map Unit Setting

National map unit symbol: hhpj
Elevation: 20 to 130 feet
Mean annual precipitation: 18 to 20 inches
Mean annual air temperature: 61 degrees F
Frost-free period: 250 to 300 days
Farmland classification: Not prime farmland

Map Unit Composition

Riverwash: 85 percent
Xerofluvents and similar soils: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Riverwash

Setting

Landform: Flood plains
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Gravelly alluvium

Typical profile

H1 - 0 to 60 inches: variable

Properties and qualities

Slope: 0 to 2 percent
Runoff class: Negligible
Depth to water table: About 0 inches
Frequency of flooding: Frequent

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 8w
Hydric soil rating: Yes

Description of Xerofluvents

Setting

Landform: Flood plains
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear

Properties and qualities

Depth to restrictive feature: More than 80 inches
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 7w
Hydric soil rating: No

205—Rossmoor-Urban land complex, 0 to 2 percent slopes

Map Unit Setting

National map unit symbol: hhpl
Elevation: 30 to 110 feet
Mean annual precipitation: 20 inches
Mean annual air temperature: 61 degrees F
Frost-free period: 275 to 300 days
Farmland classification: Not prime farmland

Map Unit Composition

Rossmoor and similar soils: 55 percent
Urban land: 30 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Rossmoor

Setting

Landform: Flood plains
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium

Typical profile

H1 - 0 to 6 inches: fine sandy loam
H2 - 6 to 62 inches: fine sandy loam

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Well drained
Runoff class: Very low
Capacity of the most limiting layer to transmit water (Ksat): High (1.98 to 5.95 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: Rare
Frequency of ponding: None
Available water storage in profile: Moderate (about 7.8 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 3c

Hydrologic Soil Group: A
Hydric soil rating: No

Description of Urban Land

Typical profile
H1 - 0 to 6 inches: variable

Interpretive groups
Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 8
Hydric soil rating: No

Minor Components

Columbia
Percent of map unit: 6 percent
Landform: Flood plains
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Hydric soil rating: Yes

Americanos
Percent of map unit: 5 percent
Hydric soil rating: No

Unnamed, gravelly substratum
Percent of map unit: 2 percent
Hydric soil rating: No

Unnamed, unloamy sandamed
Percent of map unit: 2 percent
Hydric soil rating: No

242—Xerofluvents, 0 to 2 percent slopes, flooded

Map Unit Setting
National map unit symbol: hhqs
Elevation: 20 to 140 feet
Mean annual precipitation: 14 inches
Mean annual air temperature: 61 degrees F
Frost-free period: 250 to 300 days
Farmland classification: Not prime farmland

Map Unit Composition
Xerofluvents and similar soils: 90 percent
Minor components: 10 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Xerofluvents

Setting

Landform: Flood plains
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium

Typical profile

H1 - 0 to 60 inches: variable

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Somewhat excessively drained
Runoff class: Very low
Depth to water table: More than 80 inches
Frequency of flooding: Occasional
Frequency of ponding: None

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 6w
Hydric soil rating: Yes

Minor Components

Riverwash

Percent of map unit: 4 percent
Landform: Channels
Hydric soil rating: Yes

Rossmoor

Percent of map unit: 3 percent
Hydric soil rating: No

Xerorthents

Percent of map unit: 3 percent
Hydric soil rating: No

247—Water

Map Unit Composition

Water: 100 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

B3 Memorandum Documenting the Reconnaissance Level Surveys Conducted for the Arden Pond Mitigation Site for the American River Watershed Common Features Project

memorandum

date	May 4, 2021
to	KC Sorgen, SAFCA
cc	
from	Christy Dawson, ESA
subject	Memorandum Documenting the Reconnaissance Level Surveys Conducted for the Arden Pond Mitigation Site for the American River Watershed Common Features Project

Introduction

The purpose of this memorandum is to document the results of the reconnaissance level surveys conducted within the Arden Pond Mitigation Site proposed for the American River Watershed Common Features Project. The location of the Arden Pond Mitigation Site is shown on **Figure 1**.

The proposed Arden Pond Mitigation Site is located in the William B. Pond Recreation Area on the right bank floodplain at approximately LAR RM 12, as illustrated in **Figure 2**. The main stem of the river channel is single threaded upstream and downstream of the pond area. At RM 13.2, there is a system of braided side channels along the right bank of the river that conveys flows through the approximately 33-acre pond. The outlet of the pond transitions into the main channel at RM 11.9. The pond is currently a recreational attraction for fishing and river sport activities. The pond provides habitat for native and non-native warm water fish throughout the year.

Methodology

Environmental Science Associates (ESA) biologists Joe Sanders and Chuck Hughes conducted reconnaissance-level surveys of the Arden Pond Mitigation Site in September and October of 2020. The surveys were conducted to document vegetation communities and to map elderberry (*Sambucus* ssp.) shrubs present within and adjacent to the Arden Pond Mitigation Site. Elderberry shrubs were mapped because they are the sole hosts for the federally listed valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*; VELB). The VELB surveys were conducted consistent with the methods described in U.S. Fish and Wildlife Service (USFWS) Framework for Assessing Impacts to the Valley Elderberry Longhorn Beetle for VELB (USFWS, 2017).

Vegetative Communities

Natural communities within the Arden Pond Mitigation Site includes open water, grassland, native woodland (includes both mixed oak woodland and riparian woodland), non-native herbaceous, non-native woodland, and disturbed/developed (**Figure 3**).

Annual Grassland

Common grass species observed in this community include wild oat (*Avena barbata*), bromes (*Bromus diandrus*, *B. hordeaceus*), foxtail barley (*Hordeum murinum*), rattail sixweeks grass (*Festuca myuros*), Bermuda grass (*Cynodon dactylon*), and Pacific bentgrass (*Agrostis avenacea*).Native woodland includes valley oak (*Quercus lobata*), coast live oak (*Quercus agrifolia*), interior live oak (*Quercus wislizeni*), northern California black walnut

(*Juglans hindsii*), and California bay (*Umbellularia californica*) with an understory comprised of California rose (*Rosa californica*), California blackberry (*Rubus ursinus*), Himalayan blackberry (*Rubus armeniacus*), and coyote brush (*Baccharis pilularis* ssp. *consanguinea*).

An assemblage of native and non-native forbs is also present in these grasslands. Some common native forbs observed include Canada horseweed (*Erigeron canadensis*), telegraph weed (*Heterotheca grandiflora*), ragweed (*Ambrosia psilostachya*), elegant clarkia (*Clarkia unguiculata*), and turkey mullein (*Croton setigerus*). Among the many common non-native forbs observed are hairy vetch (*Vicia villosa*), cutleaf geranium (*Geranium dissectum*), Italian thistle (*Carduus pycnocephalus*), yellow star thistle (*Centaurea solstitialis*), prickly lettuce (*Lactuca serriola*), poison hemlock (*Conium maculatum*), wild radish (*Raphanus sativus*), wild mustard (*Hirschfeldia incana*), rose clover (*Trifolium hirtum*), and annual yellow clover (*Melilotus indicus*).

Annual grassland provides little cover for most wildlife, yet numerous species forage and several species breed in this habitat type. Grasslands attract bumble bees and other insects that rely on flowering grassland species. They also attract reptiles and amphibians such as western fence lizard (*Sceloporus occidentalis*), common garter snake (*Thamnophis sirtalis*), gopher snake (*Pituophis melanoleucus*), and Sierran treefrog (*Pseudacris regilla*); and birds such as California quail (*Callipepla californica*), western bluebird (*Sialia mexicana*), and lesser goldfinch (*Carduelis psaltria*).

Common small mammals expected to occur in grasslands include western harvest mouse (*Reithrodontomys megalotis*), deer mouse (*Mus musculus*), California vole (*Microtus californicus*), black-tailed jackrabbit (*Lepus californicus*), black-tailed deer (*Odocoileus hemionus*), coyote (*Canis latrans*), and Botta's pocket gopher (*Thomomys bottae*). Small rodents, reptiles, and invertebrates attract raptors (birds of prey) including red-tailed hawk (*Buteo jamaicensis*), red-shouldered hawk (*Accipiter striatus*), and American kestrel (*Falco sparverius*), and special-status birds such as white-tailed kite (*Elanus leucurus*), burrowing owl (*Athene cunicularia*), and Swainson's hawk (*Buteo swainsoni*).

Non-native grasslands are important foraging grounds for aerial and ground-foraging insect eaters such as Myotis (*Myotis* sp.) bat species and pallid bats (*Antrozous pallidus*).

Mixed Oak Woodland

Mixed oak woodlands that occur in relatively higher elevation portions of the Arden Pond Mitigation Site are dominated by coast live oak (*Quercus agrifolia*), valley oak (*Q. lobata*), and interior live oak (*Q. wislizeni*) (**Figure 3**). Northern California black walnut (*Juglans hindsii*) and California bay (*Umbellularia californica*) are less frequent contributors to the tree canopy.

The oak woodlands support a variety of understory plant species and vegetative structures. When no shrub layer is present, annual grassland is the dominant understory and includes the common species described above for this community. When oak woodlands support understory shrubs, common native shrubs observed include California rose (*Rosa californica*), California blackberry (*Rubus ursinus*), blue elderberry (*Sambucus nigra* ssp. *caerulea*), and coyote brush (*Baccharis pilularis* ssp. *consanguinea*). Himalayan blackberry (*Rubus armeniacus*), a non-native shrub occurs in the understory of oak woodlands.

ARCF 2016 American River Contract 2

Figure 3
Natural Communities of the Lower American River Arden Pond Mitigation Site

ESA

Animals present in oak woodland habitat include those that rely heavily on acorns, such as the acorn disseminators western scrub jay (*Aphelocoma californica*), acorn woodpecker (*Melanerpes formicivorus*), and western gray squirrel (*Sciurus griseus*). Wild turkey (*Meleagris gallopavo*), California quail, and black-tailed deer use acorns as a major food source. Deer also use the foliage of several hardwoods.

Oak titmouse (*Baeolophus inornatus*), dark-eyed junco (*Junco hyemalis*), ash-throated flycatcher (*Myiarchus tuberculifer*), northern flicker (*Colaptes auratus*), lesser goldfinch, and great horned owl (*Bubo virginianus*) nest in woodland habitat. Cavity nesters include western bluebird and ash-throated flycatcher. Special-status birds such as Cooper's hawk (*Accipiter cooperii*) and sharp-shinned hawk (*A. striatus*) are known to nest in these woodlands. The pallid bat, also a special-status species, may inhabit these woodlands as well.

Amphibians and reptiles can be found on the woodland floor where moisture is retained under fallen wood and in tree crevices. Among these species are California toad (*Anaxyrus boreas halophilus*) and Sierran treefrog. Reptiles include western fence lizard, southern alligator lizard (*Elgaria multicarinata* ssp. *multicarinata*), ringneck snake (*Diadophis punctatus*), gopher snake, western rattlesnake (*Crotalus viridis helleri*), and California king snake (*Lampropeltis zonata*).

Upland Scrub

Upland scrub habitat consists of areas dominated by native and non-native shrubs that have no tree cover and contain the common herbaceous species described above for annual grassland. Common native shrub species observed are coyote brush, blue elderberry, California rose, California blackberry, Himalayan blackberry, California grape (*Vitis californica*), and western redbud (*Cercis occidentalis*).

Many of the wildlife species described above for oak woodland also use adjacent upland scrub areas for foraging or cover.

Wetlands and Other Waters

A delineation conducted for the Arden Pond Mitigation Site on January 21, 2021 by Environmental Science Associates biologists identified approximately 77.18 acres of potential waters of the United States. This includes 56.96 acres of perennial riverine (i.e., American River), 17.49 acres of seasonally flooded forested wetlands that are comprised of a riparian woodland overstory and a riparian scrub understory, 2.11 acres of seasonally flooded scrub, which is comprised primarily of riparian scrub with no overstory, and 0.62 acres of emergent wetland occur within Arden Pond Mitigation Site(Appendix C).

Wetland and other waters habitat for the Arden Pond Mitigation Site are described below.

Riparian Scrub (Scrub-shrub)

Riparian scrub habitat consists of shrub-dominated areas that are subject to hydrologic influence from the American River. These areas are dominated by sandbar willow (*Salix exigua*), arroyo willow (*S. lasiolepis*), common button bush (*Cephalanthus occidentalis*), California rose, California blackberry, California wild grape, blue elderberry, and Himalayan blackberry.

Areas that experience high flows typically do not support herb species, and cobbles tend to be the dominant ground cover. Areas that experience slower flows support a variety of herb species including mugwort (*Artemisia douglasiana*), marsh brittlegrass (*Setaria parviflora*), Santa Barbara sedge (*Carex barbarae*), horsetails

(*Equisetum arvense* and *E. hymale* ssp. *affine*), rushes (*Juncus balticus*, *J. bufonius*, *J. effusus*, and *J. patens*), beardless wildrye (*Elymus triticoides*), and water iris (*Iris pseudacorus*).

Riparian scrub supports large numbers of insects and attracts passerine birds, including several species of flycatchers, warblers, and hummingbirds.

Riparian Woodland

Riparian woodlands are tree-dominated areas that are subject to frequent hydrologic influence from the American River. These areas are dominated by Fremont cottonwood (*Populus fremontii*), Goodding's willow (*Salix gooddingii*), red willow (*S. laevigata*), white alder (*Alnus rhombifolia*), Oregon ash (*Fraxinus latifolia*), and/or California sycamore (*Platanus racemosa*). Pacific willow (*Salix lasiolepis*), valley oak, American elm (*Ulmus americana*), and black locust (*Robinia pseudoacacia*) are less frequent contributors to the tree canopy. Riparian woodlands support a variety of shrubs and herbs similar to those described above for the riparian scrub community.

Many wildlife species depend on riparian woodlands for water, food, and cover. Several raptor species—red-shouldered hawk, Cooper's hawk, great horned owl, and the State-listed Swainson's hawk—build their nests in the crowns of cottonwood, valley oak, and other large trees that grow on the landside and waterside of the levees. Natural cavities and woodpecker holes provide nesting sites for cavity-nesting species, including wood duck (*Aix sponsa*), American kestrel, tree swallow (*Tachycineta bicolor*), western bluebird, and western screech owl (*Megascops kennicottii*).

Riverine

Riverine habitat consists of inundated areas, including the American River. Such areas support submerged non-native aquatic vegetation: Brazilian waterweed (*Egeria densa*), curly pondweed (*Potamogeton crispus*), and water primrose (*Ludwigia hexapetala*). Many bird species use open waters for resting, hunting, and escape cover. Common species include gulls, waterfowl, and osprey (*Pandion haliaetus*). Shorelines provide hunting grounds for wading birds such as herons and egrets, and for kingfisher, waterfowl, and shorebirds. Flycatchers, swallows, and other insectivorous birds catch their prey over water. Mammal species that occur in this habitat type include river otter (*Lontra canadensis*) and beaver (*Castor canadensis*). Instream woody structure along the shoreline of riverine habitat provides perching habitat for bird species such as black phoebe (*Sayornis nigricans*) and resting or basking habitat for other species (e.g., western pond turtle [*Actinemys marmorata*] and river otter).

Emergent Wetland

Emergent wetland is dominated by perennial aquatic emergent vegetation and annual hydrophytic forbs. Vegetation is typically dominated by spikerush (*Eleocharis macrostachya*), rushes (*Juncus* spp.), or vervain (*Verbena bonariensis*). The emergent wetland on the north side of the lagoon is disturbed by frequent foot traffic and has compacted soils. Emergent wetlands are among the most productive wildlife habitats in California. They provide food, cover, and water for birds, mammals, reptiles, and amphibians. Many species rely on fresh emergent wetlands for their entire life cycle.

Non-native Woodland

Non-native woodland includes single-species tree stands of either Australian pine (*Casuarina equisetifolia*), black locust, or tree of heaven (*Ailanthus altissima*).

Bird species that may use this habitat types include scrub jay, Northern mockingbird (*Mimus polyglottos*), house finch (*Carpodacus mexicanus*), California quail, and western bluebird. Common mammals include black-tailed deer, raccoon (*Procyon lotor*), and opossum (*Didelphis virginiana*). Gopher snake and western fence lizard also occur in this habitat type.

Federally Listed and State-Listed Wildlife Species

Valley Elderberry Longhorn Beetle

The valley elderberry longhorn beetle is Federally listed as threatened. Suitable habitat for the VELB is typically defined as live elderberry (*Sambucus* spp.) stems measuring at least one inch in diameter at ground level. These beetles seldom occur above 3,000 feet in elevation. They are generally found along waterways and in floodplains that support remnant stands of riparian vegetation. The VELB is completely dependent on its host plant, the elderberry, which is a common component of the riparian forests and adjacent upland habitats of California's Central Valley and foothills. Elderberry shrubs with VELB populations occur in a variety of habitats and plant communities, but are most often found in riparian areas (USFWS, 1999, 2017).

Records for this species are restricted to small, scattered populations along the Sacramento, American, San Joaquin, Kings, Kaweah, and Tule Rivers and their tributaries. However, the species has the potential to occupy shrubs in the Central Valley and Sierra Nevada foothills. For this reason, elderberry shrubs of sufficient size (measuring at least one inch in diameter at ground level) are considered suitable habitat for this species. There are documented occurrences of VELB in the Arden Pond Mitigation Site from 1974 to 2014. This site is described in CNDDB as being one of the earliest known populations. Fresh exit holes were observed during this survey in 2020 (Environmental Science Associates, 2020).

Yellow-billed Cuckoo

The western yellow-billed cuckoo is a subspecies of the yellow-billed cuckoo and has been recognized through designation of a distinct population segment (USFWS, 2001). In 1988, the cuckoo was listed by the State as endangered under the California Endangered Species Act (CDFW, 2019c). In 2014, the cuckoo was Federally listed as threatened under the Federal Endangered Species Act, and critical habitat was proposed throughout its range, including a 69-mile-long, contiguous segment of the Sacramento River from Red Bluff to Colusa (USFWS, 2014a, 2014b). The cuckoo is typically found in riparian forests with dense deciduous trees and shrubs, primarily in riparian forests and associated bottomlands dominated by willow, cottonwood, or mesquite (Gaines and Laymon, 1984; Laymon and Halterman, 1987; Hughes, 1999; Halterman et al., 2001).

This subspecies was once common throughout California (Grinnell and Miller, 1944), but the population has declined over the last 100 years following extensive loss of riparian habitat. In California, cuckoos are consistently found in only a few isolated areas: the Sacramento Valley (between Red Bluff and Colusa), the Feather River (between Gridley and Nicolaus), the South Fork of the Kern River, and several Lower Colorado River Multi-Species Conservation Program restoration sites on the California side of the lower Colorado River (Gaines and Laymon, 1984; Laymon and Halterman, 1989; Laymon, 1998; Halterman et al., 2001; Dettling and Seavy, 2012).

Until recently, the Upper Sacramento River was believed to have one of the largest cuckoo populations in California. However, surveys have documented a dramatic decline in this population (Halterman et al., 2001; Dettling and Howell, 2011; Dettling et al., 2014). Riparian vegetation in this area has increased by almost 5,000

acres since 1996 as a result of restoration efforts (Golet et al., 2008). Gaines and Laymon (1984) suggested, however, that many large patches along the Sacramento River in Tehama County and along the Feather River appeared to be unoccupied even though they apparently represent suitable habitat. Follow-up surveys were conducted in 1987 and 1999, and between one and six individuals were found along the Feather River between Oroville and Nicolaus (Laymon and Halterman, 1989; Halterman et al., 2001).

Until very recently, the last documented occurrence in the CNDDB in the vicinity of the Arden Pond Mitigation Site was from the late 1800s. However, on July 27, 2019, a cuckoo vocalization was documented approximately three miles downstream on a heavily forested island in the American River (Ron Melcer Jr., Delta Stewardship Council, pers. comm., July 28, 2019). The bird was not observed and the nesting status is unknown.

The Arden Pond Mitigation Site provides marginal remnant riparian habitat that may be used for foraging or dispersal. However, the riparian habitat in the Arden Pond Mitigation Site does not meet the typical size requirements (25 contiguous acres or more) for home ranges of nesting yellow-billed cuckoos (USFWS, 2001).

Swainson's Hawk

Swainson's hawk is State-listed as threatened. It once occupied large grassland and shrub steppe habitats, as well as canyons, foothills, and smaller interior valleys in otherwise mountainous regions. Currently, the species is most common in the Central Valley and Great Basin. Nesting habitat for Swainson's hawk includes mature trees with relatively dense canopies such as oaks or cottonwoods in or near riparian habitat, agricultural fields, or suburban neighborhoods near suitable foraging habitat. They forage in grasslands, irrigated pastures, and grain fields. In California, Swainson's hawks begin nesting in late March, and the young usually leave the nest (fledge) by August.

The closest CNDDB occurrence of Swainson's hawk is approximately 1.5 miles northeast of the Arden Pond Mitigation Site. The pair was last observed nesting in 2004. More recently in 2010, a pair was observed 2.5 miles south of Arden Pond. Nesting was confirmed and two juveniles fledged. Additionally, there has been a regularly documented nest just upstream of Howe Avenue (Sorgen, K. C. pers. comm., 2019) and a potential nesting pair was observed in May 2019 by a DWR survey team on the river's right bank just downstream of Watt Ave, approximately 3.5 miles west of the Arden Pond Mitigation Site (Lori Price, pers. comm., 2019). The large trees within the riparian corridor and adjacent parks could provide nesting sites and annual grasslands and nearby parks provide suitable foraging habitat.

Non-listed Special-Status Wildlife Species

Western Pond Turtle

The western pond turtle is a California species of special concern. This moderate-sized aquatic turtle is commonly found in ponds, lakes, marshes, rivers, streams, and irrigation ditches with rocky or muddy substrates. Its habitat often exhibits shoreline basking areas that may or may not be bordered by aquatic vegetation. Aquatic sites are often within woodlands, grasslands, and open forests, between sea level and 6,000 feet in elevation. Pond turtles bask on logs or other objects when water temperatures are lower than air temperatures. Their nests are created in upland areas with friable soils, often up to 0.25 miles from an aquatic site (Jennings and Hayes, 1994; Stebbins, 2003; Zeiner et al., 1988).

Western pond turtles are discontinuously distributed throughout California west of the Cascade-Sierran crest (Jennings and Hayes, 1994). They were documented by the CNDDB within the nine-quadrangle area and are likely to occur in the pond.

Cooper's Hawk

The Cooper's hawk is a CDFW watch list species. This medium-sized accipiter is a resident of wooded areas throughout California, with breeding described throughout the Coast Ranges and Sierra Nevada foothills. The Cooper's hawk forages mostly on small birds and mammals, although it will also take reptiles and amphibians. The species' peak nesting season is May through July, although nesting may occur any time from March to August (Zeiner et al., 1990a).

There is one known CNDDB occurrences of Cooper's hawk just upstream of the Arden Pond Mitigation Site documented in 1988 (CDFW, 2021a). However, there are several occurrences throughout the American River Parkway documented as recently as 2008. Woodland habitat in and near the Arden Pond Mitigation Site provides potential nesting opportunities for this species.

White-Tailed Kite

The white-tailed kite is a fully protected species under the California Fish and Game Code. This species nests primarily in riparian and lowland habitats often associated with agricultural areas throughout cismontane California. White-tailed kites typically nest in dense vegetation at the tops of oaks, willows, or other native trees. They prey primarily on voles and other diurnal mammals (CDFG, 2005). Their numbers and range have increased in the past few decades (CDFG, 2005).

There are several occurrences of white-tailed kite throughout the American River Parkway and there is one known CNDDB occurrences in the Arden Pond Mitigation Site documented in 2009 (CDFW 2021). The Arden Pond Mitigation Site provides trees suitable for nesting and potential foraging habitat is available along the levees and in nearby parks and open grasslands. White-tailed kites were not observed during the surveys.

Other Breeding and Migratory Birds

The Federal Migratory Bird Treaty Act and California Fish and Game Code protect raptors, most native migratory birds, and breeding birds that could be present in the Arden Pond Mitigation Site. Arden Pond provides high-quality foraging and nesting opportunities for a variety of resident and migratory birds. Common raptor species that may nest in the mature trees of the parkway could include red-tailed hawk, red-shouldered hawk, and great horned owl. Wading birds such as the great egret and the great blue heron are known to nest upstream and downstream of the Arden Pond Mitigation Site, and have been observed foraging in the Arden Pond Mitigation Site. Additionally, Arden Pond provides habitat for nesting waterfowl and shorebirds.

Western Red Bat

The western red bat is a California species of special concern. This is a riparian obligate species (i.e., dependent on riparian habitat) that is ubiquitous throughout California except the northern Great Basin region. Western red bats roost individually in dense clumps of tree foliage in riparian areas, orchards, and suburban areas. They are primarily moth specialists, but will forage for a variety of other insects. Individuals have been observed foraging around street lamps and floodlights in suburban areas (WBWG, 2005).

Based on its tendency to roost within tree foliage, this species may be intermittently present in the riparian and woodland habitat in the Arden Pond Mitigation Site; however, roosting occurrences are not reported by the CNDDB within five miles of the Arden Pond Mitigation Site or within the nine-quadrangle area that includes the Arden Pond Mitigation Site.

Critical Habitat for Listed Wildlife Species

USFWS defines the term “critical habitat” in the Federal Endangered Species Act as a specific geographic area(s) that contains features essential for the conservation of a threatened or endangered species and that may require special management and protection. The Arden Pond Mitigation Site is not within designated critical habitat for any listed terrestrial wildlife species.

B4 Memorandum Documenting the Reconnaissance Level Survey Conducted for the Rossmoor and Stockpile Locations for the American River Watershed Common Features Project

memorandum

date	March 9, 2021
to	KC Sorgen, SAFCA
cc	
from	Christy Dawson, ESA
subject	Memorandum Documenting the Reconnaissance Level Survey Conducted for the Rossmoor and Stockpile Locations for the American River Watershed Common Features Project

Introduction

The purpose of this memorandum is to document the results of the reconnaissance level survey conducted within the Rossmoor Mitigation Sites and Stockpile Locations proposed for the American River Watershed Common Features Project. The study area includes Rossmoor East and West Mitigation Sites and the Potential Benvenuti and City/Two Rivers and PG&E Stockpile Locations. The locations of the study area are shown on **Figure 1**.

Methodology

Environmental Science Associates (ESA) biologists Kelly Bayne and Chuck Hughes conducted a reconnaissance-level survey of the study area on January 11, 2021. The survey was conducted to document vegetation communities and to map elderberry (*Sambucus* ssp.) shrubs present within and adjacent to the study area. Elderberry shrubs were mapped because they are the sole hosts for the federally listed valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*; VELB). The VELB surveys were conducted consistent with the methods described in U.S. Fish and Wildlife Service (USFWS) Framework for Assessing Impacts to the Valley Elderberry Longhorn Beetle for VELB (USFWS, 2017).

Vegetative Communities

Rossmoor Mitigation Sites

Natural communities within the Rossmoor mitigation east and west sites include non-native grassland and native woodland. Non-native grassland and native woodland also occurs to the west of the Rossmore mitigation sites and to the east of the American River. Vegetation communities within and in the vicinity of the Rossmoor mitigation sites are shown in **Figure 2**.

The grasslands consist mainly of non-native grasses and forbs including wild oat (*Avena barbata*), bromes (*Bromus diandrus, B. hordeaceus*), foxtail barley (*Hordeum murinum*), rattail sixweeks grass (*Festuca myuros*), Bermuda grass (*Cynodon dactylon*), hairy vetch (*Vicia villosa*), cutleaf geranium (*Geranium dissectum*), Italian thistle (*Carduus pycnocephalus*), yellow star thistle (*Centaurea solstitialis*), prickly lettuce (*Lactuca serriola*),

poison hemlock (*Conium maculatum*), wild radish (*Raphanus sativus*), wild mustard (*Hirschfeldia incana*), rose clover (*Trifolium hirtum*), white sweet clover (*Melilotus indicus*), Canada horseweed (*Erigeron canadensis*), telegraph weed (*Heterotheca grandiflora*), ragweed (*Ambrosia psilostachya*), and turkey-mullein (*Croton setigerus*).

Native woodland includes valley oak (*Quercus lobata*), coast live oak (*Quercus agrifolia*), interior live oak (*Quercus wislizeni*), Northern California black walnut (*Juglans hindsii*), and California bay (*Umbellularia californica*) with an understory comprised of California rose (*Rosa californica*), California blackberry (*Rubus ursinus*), Himalayan blackberry (*Rubus armeniacus*), and coyote brush (*Baccharis pilularis* ssp. *consanguinea*).

Potential Stockpile Locations

No natural vegetative communities occur within the potential stockpile locations. Non-native communities include disturbed areas associated with a graded parking lot comprised of minimal weedy vegetation and mowed/tilled lots with extensive amounts of garbage scattered throughout. Non-native grasses and forbs including wild oat, yellow star thistle, bromes, and foxtail barley occur throughout the disturbed areas. A single mature oak (*Quercus* sp.) tree occurs within the City/Two Rivers and PG&E stockpile location. Limits of the exact stockpile locations are unknown at this time; however, **Figure 3** identifies the proposed vicinity.

Critical Habitat

The USFWS designated critical habitat for VELB to the west of the Rossmoor east and west mitigation sites (**Figure 4**). As shown in **Figure 2**, blue elderberry (*Sambucus nigra* ssp. *caerulea*) shrubs occur in the non-native grassland and the native woodland to the west of the Rossmoor mitigation sites. The elderberry shrubs were mapped as a point for a single shrub or as a polygon for clump of shrubs located within 16 feet of each other. There is no designated critical habitat for VELB mapped in the vicinity of the potential stockpile locations.

CHAPTER 1
Introduction

This report documents the results and conclusions of an aquatic resources delineation conducted for the American River Common Features 2016 Project, American River Contract 1 and 2 (Project). The Project is located in the City of Sacramento along the American River (**Figure 1-1**). The project area encompasses portions of the river as well as adjoining levees and other adjacent areas (**Figure 1-2**). The delineation was conducted on behalf of the U.S. Army Corps of Engineers (Corps), Central Valley Flood Protection Board, and Sacramento Area Flood Control Agency (SAFCA) (Project Partners).

1.1 Purpose

The purpose of this investigation is to describe and delineate all potential wetlands and other waters of the U.S. within the project area that may be subject to regulation under Section 404 of the Clean Water Act. The boundaries of the aquatic features reflected in this report were delineated based on field and other data and reflect the best professional judgment of investigators. All conclusions presented should be considered preliminary and subject to change pending review and verification by the Corps.

1.2 Location

The project area comprises approximately 149.21 acres. It extends from Paradise Bend at approximately river mile 5.4, near the City of Sacramento's Glenn Hall Park, upstream along the American River to just past the Howe Avenue Bridge at approximately river mile 7.9. The project area is mostly within the American River Parkway and includes several paved, gravel and dirt trails. It includes all or portions of the Campus Commons Golf Course, the H Street Bridge, the Guy West Bridge, the Howe Avenue Bridge, and University Park. An aerial photograph map of the project area is provided in Figure 1-2.

The project area falls within Sections 3, 10, and 11 (Township 8 North, Range 5 East) of the Sacramento East, California U.S. Geological Survey (USGS) 7.5-minute series quadrangle. The approximate centroid of the project area is 38.567864º North, 121.422750º West. Elevation ranges from approximately 17 to 47 feet above mean sea level. The project area is in the mapped floodplain of the American River (FEMA, 2019). USGS Hydrologic Unit Code = 18020111. Located entirely in Sacramento County, California.

1.3 Responsible Parties

The Project owner is:

U.S. Army Corps of Engineers, Sacramento District
1325 J Street
Sacramento, California 95814-2922

The point of contact for this report is:

Mr. Gerrit Platenkamp, Ph.D., Project Manager
Environmental Science Associates
2600 Capitol Avenue, Suite 200
Sacramento, CA 95816
(916) 564-4500
gplatenkamp@esassoc.com

1.4 Directions to Site

Since the project area encompasses both banks of the American River, directions are given separately for points of access for both banks from downtown Sacramento.

Directions to the left bank access point at Glenn Hall Park:

- Take J Street east about 3.5 miles to Carlson Drive.
- Turn left onto Carlson Drive.
- Travel north on Carlson Drive for about 1.0 mile to the Glenn Hall Park parking lot.

Directions to the right bank access point at Campus Commons Golf Course:

- Take J Street east about 4.1 miles to Cadillac Drive (J Street turns into Fair Oaks Boulevard after crossing the bridge over the American River).
- Turn left onto Cadillac Drive.
- Travel about 0.4 mile on Cadillac Drive to the Campus Commons Golf Course parking lot.

CHAPTER 2
Methods

2.1 Pre-field Review

Prior to conducting fieldwork, the following background tasks were performed:

- Review of current and historic Sacramento East, California U.S. Geologic Survey (USGS) topographic maps (USGS, 2019);
- Review of current and historic aerial photography (Google, Inc., 2019);
- Review of the online soil survey (NRCS, 2019a) for information about soils and geomorphology;
- Review of the National Hydric Soils List (NRCS, 2019b) to determine if any soil mapping unit components are considered hydric;
- Review of the National Wetlands Inventory (U.S Fish and Wildlife Service [USFWS], 2019);
- Review of the Sacramento Corps District Navigable Waterways (Corps, 2019); and
- Review of the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM) (FEMA, 2019).

2.2 Field Survey Methods

Field investigations were conducted by Environmental Science Associates (ESA) biologists Chuck Hughes and Joseph Sanders on July 8, 2019 and by Chuck Hughes and Emily Dorrance on July 24, 2019. The delineation used the "Routine Determination Method" as described in the *1987 Corps of Engineers Wetland Delineation Manual* (Environmental Laboratory, 1987), hereafter called the "1987 Manual." The 1987 Manual was used in conjunction with the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0)* (USACE, 2008), hereafter called the "Arid West Supplement." For areas where the 1987 Manual and the Arid West Supplement differ, the Arid West Supplement was followed. In addition, the *Guide to Ordinary High Water Mark (OHWM) delineation for non-perennial streams in the western mountains, valleys, and coast region of the United States* (USACE, 2014) was used to identify the lateral limits of streams. Although the American River is a perennial watercourse, the Corps does not have an OHWM manual for perennial streams.

The Arid West Supplement is applicable for use at the site because the project area experiences hot, dry summers typical of a Mediterranean climate, and the surrounding landscape in the bottom of the valley is dominated by oaks (Corps, 2008). The Arid West Supplement was used for this

delineation based on landscape, site conditions, vegetation, and climate. The Western Mountains, Valleys, and Coast Region OHWM guide was used for delineating the boundaries of other waters. The Western Mountains OHWM guide was used because watercourses in the vicinity of the project area are more similar to those described by that guide than those described by the Arid West OHWM Guide.

ESA assessed presence or absence of positive indicators for wetland vegetation, soils, and hydrology per the 1987 Manual and Arid West Supplement. Data points were recorded on Arid West wetland determination data forms (**Appendix A)**.

At each data point, a visual assessment of the plant cover by species was made. Dominant species were assessed using the "50/20" rule per the Arid West Supplement. Plants were identified to species using *The Jepson Manual: Vascular Plants of California, second edition* (Baldwin et al., 2012). The *Arid West 2016 Regional Wetland Plant List* (Lichvar et al., 2016) was used to determine the wetland indicator status of all plants. Soils at each data point were characterized by color, texture, organic matter accumulation, and the presence or absence of hydric soil indicators. Color was described using the *Munsell Soil Color Book* (Munsell Color, 2015). Presence of wetland hydrology was determined at each data point by presence of one or more of the primary and/or secondary indicators, per the Arid West Supplement.

For "other waters of the U.S." to be considered jurisdictional, these features must exhibit a defined bed and bank and an OHWM.

2.3 Mapping and Acreage Calculations

Data points, and some point locations of the OHWM, were recorded using a Global Positioning System (GPS) unit (Trimble GeoXT) with real-time differential correction and an instrument-rated mapping accuracy of +/- 1 meter. Field indicators of the OHWM matched well with the water elevation at an American River flow of 18,500 cubic feet per second (cfs). The 18,500 cfs elevation is the 2-year flood event and was used for the OHWM throughout the project area. The 18,500 cfs elevation was based on hydraulic modeling and provided digitally by Northwest Hydraulic Consultants in 2018.

Terrestrial areas below the OHWM but above the water's edge with at least 5 percent vegetation cover were identified based on aerial photography and mapped as wetlands. GPS and aerial photograph information were combined in ArcGIS. Acreage of wetland and waters, and the length of linear features were determined using ArcGIS.

2.4 Limitations

No problems or limitations were encountered during the field investigations.

CHAPTER 3
Regulatory Setting

3.1 Waters of the U.S.

In 2015, the Corps and the Environmental Protection Agency (EPA) issued the Clean Water Rule detailing the process for determining Clean Water Act (CWA) jurisdiction over waters of the U.S. The rule is currently in effect in California and 21 other states. The 2015 Clean Water Rule (33 CFR 328.3) includes a detailed process for determining which areas may be subject to jurisdiction under the CWA, and defines features that are and are not waters of the U.S. Waters of the U.S. include all Traditional Navigable Waters (TNW) and may include certain wetlands and other waters such as perennial, intermittent and ephemeral streams that are tributaries to a TNW, as described below.

Some features require a significant nexus test to determine if they are waters of the U.S. The significant nexus test includes consideration of hydrologic and ecologic factors. The significant nexus test takes into account physical indicators of flow (evidence of an OHWM), if a hydrologic connection to a TNW exists, and if the aquatic functions of the water body have a significant effect (more than speculative or insubstantial) on the chemical, physical, and biological integrity of a TNW. A significant nexus test includes similarly situated waters in the watershed. The Corps and EPA apply the significant nexus standard to assess the flow characteristics and functions of a potential water of the U.S. to determine if it significantly affects the chemical, physical, and biological integrity of the downstream TNW.

3.1.1 Traditional Navigable Water

Navigable waters of the United States are defined in 33 CFR § 329.4 as "…those waters that are subject to the ebb and flow of the tide and/or are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce. A determination of navigability, once made, applies laterally over the entire surface of the waterbody, and is not extinguished by later actions or events which impede or destroy navigable capacity." Traditional navigable waters include all of the "navigable waters of the United States" as defined in 33 CFR § Part 329.4 as well as by numerous decision of the federal courts; those water bodies the Corps has determined are a navigable water of the U.S. pursuant to 33. CFR § 329.14; plus all other waters that are navigable-in-fact.

3.1.2 Ephemeral, Intermittent, and Perennial Streams

An ephemeral stream has flowing water only during, and for a short duration after, precipitation events in a typical year. Ephemeral stream beds are located above the water table year-round.

Groundwater is not a source of water for the stream, and runoff from rainfall is the primary source of water for stream flow. An intermittent stream has flowing water during certain times of the year, when groundwater provides water for stream flow. During dry periods, intermittent streams may not have flowing water. Runoff from rainfall is a supplemental source of water for stream flow. A perennial stream has flowing water year-round during a typical year (82 Federal Register 1860).

3.1.3 Wetlands

Wetlands include those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas. Vernal pools and seasonal wetlands are other examples. As noted previously, three positive parameters must normally be present for an area to be considered a wetland: (1) a dominance of wetland vegetation, (2) presence of hydric soils, and (3) presence of wetland hydrology.

CHAPTER 4
Setting

4.1 Project Area

The project area is in the Sacramento Valley in an urbanized area and is dominated by the American River Parkway. Levees contain the river on both sides. In some locations, the river's OHWM is immediately adjacent to river, and in others it is up to approximately 590 feet away.

In the project area, the right bank has much more upland between the OHWM and the levee. Along most of the right bank in the project area, there is a steep or vertical slope from the OHWM down to the low-flow channel of the river, and areas between the OHWM and the levee are nearly flat. Several trails, and the Campus Commons Golf Course, are located in the flat area between the OHWM and the levee.

On the left bank of the river, the OHWM is at or near the toe of the levee and there is no level floodplain present. Rip-rap has been placed below the OHWM in several locations to protect the levee.

Areas on the land side of the levees in the project area include University Park, an area adjacent to J Street, and a small portion of Glenn Hall Park. These areas are either developed or highly disturbed due to the surrounding urbanization.

The climate in the region consists of cool, wet winters and hot, dry summers. The mean annual precipitation in Sacramento is 20.27 inches and temperatures range from a mean annual maximum of 73.1 degrees Fahrenheit to an average minimum temperature of 49.8 degrees Fahrenheit (Western Regional Climate Center, 2019; NWSFO, 2019). Precipitation from July 1, 2018 through June 30, 2019 totaled 26.11 inches, which is 129% of the average annual rainfall (NWSFO, 2019). The previous winter was wetter than normal, although the project area had normal dry summertime conditions during fieldwork.

4.2 Soils

A custom soil resource report for the project area was generated and can be found in **Appendix B**. The soil report identifies three map units other than water in the project area: riverwash, Rossmoor-urban land complex, 0 to 2 percent slopes, and xerofluvents, 0 to 2 percent slopes, flooded. A brief description of the primary soils within each map unit is provided below (NRCS, 1993; 2019a). All colors refer to moist soil. All of the map units have major or minor components on the national hydric soil list where the necessary landform occurs (floodplains or channels; NRCS, 2019b).

Riverwash. This map unit consists of unstabilized stratified silty to cobbly fluvial sediment. It is shifted by flowing water almost annually and may support little or no vegetation. Riverwash is excessively drained and subject to flooding during winter and spring.

Rossmoor fine sandy loam, 0–2% slopes. Rossmoor soils formed in alluvium from mixed rocks and occur on high floodplains. They are very deep and well-drained. Native vegetation is typically valley oaks with annual grasses and forbs. Flooding is rare due to protection from levees and upstream dams. A typical profile has:

0–29 inches	Dark brown (10YR 3/3) neutral fine sandy loam.
29–62 inches	Dark yellowish brown (10YR 3/4) neutral fine sandy loam.

Urban land. This consists of areas covered by impervious surfaces. The substrate is similar to Rossmoor soils, but may have been altered.

Xerofluvents, 0–2% slopes. These are soils formed in alluvium from mixed rocks and occur on low floodplains. They are very deep and excessively- to well-drained. Native vegetation is typically oaks and other hardwoods with annual grasses and forbs, with riparian vegetation along drainageways. They are occasionally to frequently flooded in the winter and spring and may be channeled by small drainageways formed during high water.

4.3 Hydrology

The project area is in the watershed of the American River (HUC 1802011102). Portions of the project area on the land side of the levees drain to the City storm drain system and ultimately to the American River via City pumps and culverts through the levees. Most of the project area is located within the mapped floodplain of the American River. Much of the area between the levees experiences flooding during times of high water. Base flood elevations have been determined for the project area (FEMA, 2019; **Appendix C**). The Lower American River in the project area is a traditional navigable water from Bradshaw Avenue downstream to the Sacramento River confluence (Corps, 2019).

4.4 Vegetation

Plant communities are assemblages of plant species that occur together in the same area, and are defined by species composition and relative abundance. Areas on the landward side of the levees are urbanized and contain maintained landscaping. The levee sides are maintained by mowing and generally kept free of woody shrubs and trees (see photos in **Appendix D**). The levees are dominated by nonnative grasses including wild oat (*Avena barbata*) and bromes (*Bromus* spp.). Level areas on the high floodplain of the right bank are dominated by mature native oaks (*Quercus* spp.), with a patchy shrub layer including California rose (*Rosa californica*), coyote brush (*Baccharis pilularis*), and invasive Himalayan blackberry (*Rubus armeniacus*). The herb layer is dominated by nonnative grasses and fobs. Vegetation in the forested wetlands is described below.

CHAPTER 5
Results

5.1 Aquatic Resources

The aquatic resources delineation identified approximately 37.6 acres of aquatic resources within the project area, consisting of the American River, forested wetland below the OHWM of the river, and an ephemeral ditch that drains a City stormwater pump outfall to the river. Aquatic resources were classified using the *Classification of Wetlands and Deepwater Habitats of the United States* ("Cowardin Classification") (FGDC, 2013). Details are provided in **Table 1** and described below. **Figure 5-1** and **Figures 5-1a** through **5-1c** show the location and extent of the aquatic resources. The Aquatic Resources Spreadsheet is in **Appendix E**.

TABLE 1
AQUATIC RESOURCES

Aquatic Resource (Map ID)	Cowardin Classification	Acres (linear feet)
Other Waters		
American River (LAR1–LAR4)	Riverine, Lower Perennial, Unconsolidated Bottom, Permanently Flooded (R2UBH)	22.43 (8,373)
Drainage Ditch (D1)	Riverine, Intermittent, Streambed (R4SB)	0.10 (329)
	Waters Total:	**22.53 (8,702)**
Wetlands		
Forested Wetland (FW1–FW7)	Palustrine, Forested, Seasonally Flooded (PFOC)	15.04
	Wetland Total:	**15.04**
	Grand Total:	**37.57 (8,702)**

5.1.1 Other Waters

American River

The American River is a perennial, navigable watercourse. The bed in the project area consists of substrate ranging in size from mud to gravel. The OHWM was identified in the field based on changes in vegetation and scour (Appendix D, photos 1 and 2). OHWM indicators in the field matched the location of the 18,500 cfs flow elevation, and that elevation was used to delineate the OHWM boundary. Most of the river is unvegetated, or has sparse submerged aquatic vegetation including invasive Brazilian waterweed (OBL; *Egeria densa*) and curly pondweed (OBL; *Potamogeton crispus*). Areas below the 18,500 cfs OHWM elevation with at least 5% vegetation cover are identified as forested wetlands below the OHWM and are discussed below.

Drainage Ditch

A single ephemeral drainage ditch was delineated within the project area; it originates at a set of stormwater culvert outfalls. The culverts begin at a stormwater sump facility on the land side of the levee. The culverts extend from the sump, through the levee, under a bicycle path, and outfall into the ditch. The ditch is lined with concrete, but there are cracks and areas of sediment that support hydrophytic vegetation. The OHWM was identified based on the break in slope. The ditch flows through Campus Commons Golf Course and drains into the American River. There is a golf cart bridge over the ditch near the river. The ditch's hydrology is primarily influenced by discharges from the City's stormwater sump facility.

5.1.2 Wetlands

Forested Wetland

Vegetated areas below the OHWM of the American River are mapped as forested wetlands. Soils consist of riverwash, with stratified layers of fine to coarse sand, and cobble present in many locations. Recent alluvium is a naturally problematic soil as annual erosion/deposition and low organic matter may disrupt hydric indicator formation (Corps, 2008). No hydric soil indicators were met. Data point 7 had redox concentrations present, but the matrix was insufficiently depleted to meet a hydric soil indicator. Hydric soils were assumed because riverwash is naturally problematic, and because the forested wetland is below the OHWM of the river and floods on average at least once every two years. Wetland hydrology indicators consisted of fine sediments deposited on stems and woody debris from high water in early 2019, the FAC-Neutral test, and seasonal inundation visible on aerial photography. The hydrophytic vegetation parameter was met. The forested wetland has a plant community dominated by riparian trees including Fremont cottonwood (FAC; *Populus fremontii* ssp. *fremontii*), box elder (FACW; *Acer negundo* var. *californicum*), Oregon ash (FACW; *Fraxinus latifolia*), and white alder (FACW; *Alnus rhombifolia*). Much of the forested wetland has a well-developed understory/shrub layer dominated by willows (FACW; *Salix* spp.), invasive Himalayan blackberry (FAC), and California rose (FAC). Creeping wild rye (FAC; *Elymus triticoides*), nutsedge (FACW; *Cyperus eragrostis*), and curly dock (FAC; *Rumex* spp.) are common in the herb layer.

5.2 2015 Clean Water Rule Analysis

Following the delineation of aquatic resources, all features were evaluated to determine if they may be regulated under the CWA per the parameters set forth in the 2015 Clean Water Rule (CWR). **Table 2** summarizes the results of this assessment for all aquatic resources in the project area.

TABLE 2
APPLICATION OF THE 2015 CLEAN WATER RULE TO AQUATIC RESOURCES

Aquatic Resource (Map ID)	33 CFR 328.3 Waters Type	Waters of the U.S. (ac)	Excluded by Rule (ac)	Rationale
Waters				
American River (LAR1–LAR4)	(a)(1) – Navigable Water	22.43	--	Determined navigable by the Corps (2019).
Drainage Ditch (D1)	(b)(3)(i) – Ephemeral Ditch (b)(6) – Stormwater Control Feature	--	0.10	Excavated in uplands and not a relocated tributary. Source of hydrology is City stormwater pump.
Wetlands				
Forested Wetland (FW1–FW7)	(a)(6) – Adjacent	15.04	--	Adjacent to and within the OHWM of the American River.
	Total:	**37.47**	**0.10**	

5.2.1 American River

The American River is a perennial channel identified as a TNW along the entire reach in the project area by the Corps (2019). Navigable waterways that are or may be used in interstate or foreign commerce are included within the definition of waters of the U.S. at 33 CFR 328.3(a)(1).

5.2.2 Drainage Ditch

The drainage ditch begins at a culvert outfall from a pump for the City stormwater system. The ditch appears to have been excavated in uplands and no tributaries drain into it. There are no tributaries shown in the location of the ditch on topographic maps prior to development in the area (see portion of 1949 quad map in Appendix D, photograph 11). The ditch is ephemeral because the sole source of hydrology (other than direct precipitation) is stormwater discharges from the sump pump. Groundwater is not a hydrologic source for the ditch.

Ditches with ephemeral flow that are not a relocated tributary or excavated in a tributary are not waters of the U.S. (33 CFR 328.3(b)(3)(i)). Furthermore, the purpose of the ditch is to convey stormwater from the City pump to the American River. Stormwater control features constructed in dry land to convey stormwater are also not jurisdictional waters of the U.S. (33 CFR 328.3(b)(6)).

5.2.3 Forested Wetland

The forested wetland is below the OHWM of the American River and is adjacent to the river. The forested wetland is a waters of the U.S. because it is directly adjacent to a navigable water (33 CFR 328.3(a)(6)).

5.3 Conclusions

A total of 37.47 acres of potential waters of the U.S., consisting of the American River and forested wetland, occur in the project area. A total of 0.10 acre of drainage ditch which does not meet the definition of waters of the U.S. also occurs within the project area.

This report documents the wetland boundary delineation and best professional judgment of ESA investigators. All conclusions presented should be considered preliminary and subject to change pending official review and preliminary jurisdictional determination in writing by the Corps.

June 21, 2019

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require

alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

How Soil Surveys Are Made

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Sacramento County, California
Survey Area Data: Version 17, Sep 14, 2018

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Oct 12, 2016—Mar 28, 2017

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

247	Water	32.7	24.5%
Totals for Area of Interest		**133.3**	**100.0%**

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or

landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Sacramento County, California

203—Riverwash

Map Unit Setting

National map unit symbol: hhpj
Elevation: 20 to 130 feet
Mean annual precipitation: 18 to 20 inches
Mean annual air temperature: 61 degrees F
Frost-free period: 250 to 300 days
Farmland classification: Not prime farmland

Map Unit Composition

Riverwash: 85 percent
Xerofluvents and similar soils: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Riverwash

Setting

Landform: Flood plains
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Gravelly alluvium

Typical profile

H1 - 0 to 60 inches: variable

Properties and qualities

Slope: 0 to 2 percent
Runoff class: Negligible
Depth to water table: About 0 inches
Frequency of flooding: Frequent

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 8w
Hydric soil rating: Yes

Description of Xerofluvents

Setting

Landform: Flood plains
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear

Properties and qualities

Depth to restrictive feature: More than 80 inches
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 7w
Hydric soil rating: No

205—Rossmoor-Urban land complex, 0 to 2 percent slopes

Map Unit Setting

National map unit symbol: hhpl
Elevation: 30 to 110 feet
Mean annual precipitation: 20 inches
Mean annual air temperature: 61 degrees F
Frost-free period: 275 to 300 days
Farmland classification: Not prime farmland

Map Unit Composition

Rossmoor and similar soils: 55 percent
Urban land: 30 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Rossmoor

Setting

Landform: Flood plains
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium

Typical profile

H1 - 0 to 6 inches: fine sandy loam
H2 - 6 to 62 inches: fine sandy loam

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Well drained
Runoff class: Very low
Capacity of the most limiting layer to transmit water (Ksat): High (1.98 to 5.95 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: Rare
Frequency of ponding: None
Available water storage in profile: Moderate (about 7.8 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 3c

Hydrologic Soil Group: A
Hydric soil rating: No

Description of Urban Land

Typical profile
H1 - 0 to 6 inches: variable

Interpretive groups
Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 8
Hydric soil rating: No

Minor Components

Columbia
Percent of map unit: 6 percent
Landform: Flood plains
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Hydric soil rating: Yes

Americanos
Percent of map unit: 5 percent
Hydric soil rating: No

Unnamed, gravelly substratum
Percent of map unit: 2 percent
Hydric soil rating: No

Unnamed, unloamy sandamed
Percent of map unit: 2 percent
Hydric soil rating: No

242—Xerofluvents, 0 to 2 percent slopes, flooded

Map Unit Setting
National map unit symbol: hhqs
Elevation: 20 to 140 feet
Mean annual precipitation: 14 inches
Mean annual air temperature: 61 degrees F
Frost-free period: 250 to 300 days
Farmland classification: Not prime farmland

Map Unit Composition
Xerofluvents and similar soils: 90 percent
Minor components: 10 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Xerofluvents

Setting

Landform: Flood plains
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium

Typical profile

H1 - 0 to 60 inches: variable

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Somewhat excessively drained
Runoff class: Very low
Depth to water table: More than 80 inches
Frequency of flooding: Occasional
Frequency of ponding: None

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 6w
Hydric soil rating: Yes

Minor Components

Riverwash

Percent of map unit: 4 percent
Landform: Channels
Hydric soil rating: Yes

Rossmoor

Percent of map unit: 3 percent
Hydric soil rating: No

Xerorthents

Percent of map unit: 3 percent
Hydric soil rating: No

247—Water

Map Unit Composition

Water: 100 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

CHAPTER 1
Introduction

This report documents the results and conclusions of an aquatic resources delineation conducted for the American River Common Features 2016 Project, American River Contract 2 (Project) for the Arden Pond area. The Project is located in Sacramento County along the American River (**Figure 1-1**). The project area encompasses portions of the river as well as the adjoining floodplain, including some developed areas such as parking lots, access roads, and bike trails (**Figure 1-2**). The delineation was conducted on behalf of the U.S. Army Corps of Engineers (Corps), Central Valley Flood Protection Board, and Sacramento Area Flood Control Agency (SAFCA) (Project Partners).

1.1 Purpose

The purpose of this investigation is to describe and delineate all potential wetlands and other waters of the U.S. within the project area that may be subject to regulation under Section 404 of the Clean Water Act (CWA). The boundaries of the aquatic features mapped in this report were delineated based on field and other data and reflect the best professional judgment of investigators. All conclusions presented should be considered preliminary and subject to change pending review and verification by the Corps.

1.2 Location

The project area comprises approximately 130.35 acres in Sacramento County, California. Most of the project area extends along a bend of the American River from the southern end of Harrington Way at approximately river mile 11.9 upstream to the William Pond Recreation Area at approximately river mile 13.2. The Project area includes potential access roads on both the upstream and downstream ends. The project area consists mostly of a lagoon adjacent to the main stem of the river, and adjacent floodplains. An aerial photograph map of the project area is provided in Figure 1-2.

The project area falls within Sections 4 and 5 (Township 8 North, Range 6 East) and Sections 32 and 33 (Township 9 North, Range 6 East) of the Carmichael, California U.S. Geological Survey (USGS) 7.5-minute series quadrangle. The approximate centroid of the project area is 38.582154º North, 121.334839º West. Elevation ranges from approximately 31 to 60 feet above mean sea level. Most of the project area is in the floodplain of the American River (FEMA 2021) and is a designated floodway regulated by the Central Valley Flood Protection Board (DWR 2021). The project area is entirely within the Lower American USGS Hydrologic Unit (18020111).

1.3 Responsible Parties

The Project owner is:

U.S. Army Corps of Engineers, Sacramento District
1325 J Street
Sacramento, California 95814-2922

The ESA point of contact for the project is:

Mr. David Beauchamp, Project Manager
Environmental Science Associates
2600 Capitol Avenue, Suite 200
Sacramento, CA 95816
(916) 564-4500
dbeauchamp@esassoc.com

1.4 Directions to Site

The easiest access to the Project is from the William Pond Recreation Area. From downtown Sacramento:

- Take Highway 50 east to the Watt Avenue exit.
- Turn left (north) onto Watt Avenue and go about 0.8 mile to the American River Drive exit.
- Turn right (east) onto American River Drive and go about 3.2 miles. American River Drive will become McClaren Drive.
- Turn right onto Arden Drive. The gate into William Pond Recreation Area is in about 200 feet. Go to the farthest parking lot in the Recreation Area to be nearest the main portion of the project area.

CHAPTER 2
Methods

2.1 Pre-field Review

Prior to conducting fieldwork, the following background tasks were performed:

- Review of current and historic U.S. Geologic Survey (USGS) topographic maps (USGS 2021);
- Review of current and historic aerial photography (Google, Inc. 2021, UCSB 2021);

2.2 Field Survey Methods

Field investigations were conducted by Environmental Science Associates (ESA) biologists Chuck Hughes and Kelly Bayne on January 21, 2021. The delineation used the "Routine Determination Method" as described in the *1987 Corps of Engineers Wetland Delineation Manual* (Environmental Laboratory 1987), hereafter called the "1987 Manual." The 1987 Manual was used in conjunction with the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0)* (Corps 2008), hereafter called the "Arid West Supplement." For areas where the 1987 Manual and the Arid West Supplement differ, the Arid West Supplement was followed.

The Arid West Supplement is applicable for use because the project area experiences hot, dry summers typical of a Mediterranean climate, and the surrounding landscape in the bottom of the valley is dominated by oaks (Corps 2008). The Arid West Supplement was used for this delineation based on landscape, site conditions, vegetation, and climate.

ESA assessed presence or absence of positive indicators for wetland vegetation, soils, and hydrology per the 1987 Manual and Arid West Supplement. Data points were recorded on Arid West wetland determination data forms (**Appendix A**).

At each data point, a visual assessment of the plant cover by species was made. Dominant species were assessed using the "50/20" rule per the Arid West Supplement. Plants were identified to species using *The Jepson Manual: Vascular Plants of California, second edition* (Baldwin et al. 2012). The *National Wetland Plant List* (Corps 2018) was used to determine the wetland indicator status of all plants. Soils at each data point were characterized by color, texture, organic matter accumulation, and the presence or absence of hydric soil indicators. Color was described using the *Munsell Soil Color Book* (Kollmorgen Instruments Corporation 1990). Presence of wetland hydrology was determined at each data point by presence of one or more of the primary and/or secondary indicators, per the Arid West Supplement.

2.3 Mapping and Acreage Calculations

Data points and boundaries of wetlands above the ordinary high water mark (OHWM) were recorded using a Global Positioning System (GPS) with real-time differential correction and an instrument-rated mapping accuracy of +/- 1 meter. Field indicators of the OHWM as described by the Corps (2014) matched reasonably well with the water elevation at an American River flow of 18,500 cubic feet per second (cfs) based on previous work (ESA 2019). The 18,500 cubic feet per second (cfs) elevation is the 2-year flood event and was used for the OHWM throughout the project area. The 18,500 cfs elevation was based on hydraulic modeling and provided digitally by Northwest Hydraulic Consultants in 2018.

Areas below the OHWM with at least 5 percent vegetation cover were identified based on aerial photography and mapped as wetlands. GPS and aerial photograph information were combined in ArcGIS. Acreage of wetlands and waters, and the length of linear features were determined using ArcGIS.

2.4 Limitations

Emergent wetland 2 is in a low area with steep sides amongst dredge tailings that are overgrown with thick vegetation. As a result, the bottom was not accessible and no data point could be taken. The presence of emergent wetland 2 was assumed based on its landscape position, and similar circumstances and elevation compared to the nearby emergent wetlands 4 and 5. No other problems or limitations were encountered during the field investigations.

CHAPTER 3
Regulatory Setting

3.1 Rivers and Harbors Act of 1899

Section 10 of the Rivers and Harbors Act (RHA) (33 U.S.C. § 403) requires authorization from the Corps for work or structures in or affecting navigable waters of the U.S. The term “navigable waters of the U.S.” generally includes those waters that are subject to the ebb and flow of the tide and/or are presently used, or have been used in the past, or may be susceptible to use to transport interstate or foreign commerce. A determination of navigability, once made, applies laterally over the entire surface of the waterbody, and is not extinguished by later actions or events which impede or destroy navigable capacity (33 C.F.R. §329.4).

Section 14 of the RHA of 1899 (33 U.S.C. § 408), commonly referred to as “Section 408,” authorizes the Corps to grant permission to alter, occupy, or use a Corps civil works project if the Secretary determines that the activity will not be injurious to the public interest and will not impair the usefulness of the project.

3.2 Waters of the U.S.

The federal CWA establishes the basic structure for regulating discharges of pollutants into the waters of the U.S. and regulating quality standards for surface waters. The basis of the CWA was enacted in 1948 and was called the Federal Water Pollution Control Act, but the Act was significantly reorganized and expanded in 1972. "Clean Water Act" became the Act's common name with amendments in 1972.

The federal code of regulations (CFR) defines features that are and are not waters of the U.S. and defines key terms at 33 CFR 328.3:

(a) *Jurisdictional waters*. For purposes of the Clean Water Act, 33 U.S.C. 1251 *et seq*. and its implementing regulations, subject to the exclusions in paragraph (b) of this section, the term "waters of the United States" means:

(1) The territorial seas, and waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including waters which are subject to the ebb and flow of the tide;

(2) Tributaries;

(3) Lakes and ponds, and impoundments of jurisdictional waters; and

(4) Adjacent wetlands.

(b) *Non-jurisdictional waters*. The following are not "waters of the United States":

(1) Waters or water features that are not identified in paragraph (a)(1), (2), (3), or (4) of this section;

(2) Groundwater, including groundwater drained through subsurface drainage systems;

(3) Ephemeral features, including ephemeral streams, swales, gullies, rills, and pools;

(4) Diffuse stormwater run-off and directional sheet flow over upland;

(5) Ditches that are not waters identified in paragraph (a)(1) or (2) of this section, and those portions of ditches constructed in waters identified in paragraph (a)(4) of this section that do not satisfy the conditions of paragraph (c)(1) of this section;

(6) Prior converted cropland;

(7) Artificially irrigated areas, including fields flooded for agricultural production, that would revert to upland should application of irrigation water to that area cease;

(8) Artificial lakes and ponds, including water storage reservoirs and farm, irrigation, stock watering, and log cleaning ponds, constructed or excavated in upland or in non-jurisdictional waters, so long as those artificial lakes and ponds are not impoundments of jurisdictional waters that meet the conditions of paragraph (c)(6) of this section;

(9) Water-filled depressions constructed or excavated in upland or in non-jurisdictional waters incidental to mining or construction activity, and pits excavated in upland or in non-jurisdictional waters for the purpose of obtaining fill, sand, or gravel;

(10) Stormwater control features constructed or excavated in upland or in non-jurisdictional waters to convey, treat, infiltrate, or store stormwater run-off;

(11) Groundwater recharge, water reuse, and wastewater recycling structures, including detention, retention, and infiltration basins and ponds, constructed or excavated in upland or in non-jurisdictional waters; and

(12) Waste treatment systems.

(c) *Definitions*. In this section, the following definitions apply:

(1) *Adjacent wetlands*. The term *adjacent wetlands* means wetlands that:

(i) Abut, meaning to touch at least at one point or side of, a water identified in paragraph (a)(1), (2), or (3) of this section;

(ii) Are inundated by flooding from a water identified in paragraph (a)(1), (2), or (3) of this section in a typical year;

(iii) Are physically separated from a water identified in paragraph (a)(1), (2), or (3) of this section only by a natural berm, bank, dune, or similar natural feature; or

(iv) Are physically separated from a water identified in paragraph (a)(1), (2), or (3) of this section only by an artificial dike, barrier, or similar artificial structure so long as that structure allows for a direct hydrologic surface connection between the wetlands and the water identified in paragraph (a)(1), (2), or (3) of this section in a typical year, such as through a culvert, flood or tide gate, pump, or similar artificial feature. An adjacent wetland is jurisdictional in its entirety when a road or similar artificial structure divides the wetland, as long as the structure allows for a direct hydrologic surface connection through or over that structure in a typical year.

(2) *Ditch*. The term *ditch* means a constructed or excavated channel used to convey water.

(3) *Ephemeral*. The term *ephemeral* means surface water flowing or pooling only in direct response to precipitation (*e.g.*, rain or snow fall).

(4) *High tide line*. The term *high tide line* means the line of intersection of the land with the water's surface at the maximum height reached by a rising tide. The high tide line may be determined, in the absence of actual data, by a line of oil or scum along shore objects, a more or less continuous deposit of fine shell or debris on the foreshore or berm, other physical markings or characteristics, vegetation lines, tidal gages, or other suitable means that delineate the general height reached by a rising tide. The line encompasses spring high tides and other high tides that occur with periodic frequency but does not include storm surges in which there is a departure

from the normal or predicted reach of the tide due to the piling up of water against a coast by strong winds, such as those accompanying a hurricane or other intense storm.

(5) *Intermittent*. The term *intermittent* means surface water flowing continuously during certain times of the year and more than in direct response to precipitation (*e.g.*, seasonally when the groundwater table is elevated or when snowpack melts).

(6) *Lakes and ponds, and impoundments of jurisdictional waters*. The term *lakes and ponds, and impoundments of jurisdictional waters* means standing bodies of open water that contribute surface water flow to a water identified in paragraph (a)(1) of this section in a typical year either directly or through one or more waters identified in paragraph (a)(2), (3), or (4) of this section. A lake, pond, or impoundment of a jurisdictional water does not lose its jurisdictional status if it contributes surface water flow to a downstream jurisdictional water in a typical year through a channelized non-jurisdictional surface water feature, through a culvert, dike, spillway, or similar artificial feature, or through a debris pile, boulder field, or similar natural feature. A lake or pond, or impoundment of a jurisdictional water is also jurisdictional if it is inundated by flooding from a water identified in paragraph (a)(1), (2), or (3) of this section in a typical year.

(7) *Ordinary high water mark*. The term *ordinary high water mark* means that line on the shore established by the fluctuations of water and indicated by physical characteristics such as a clear, natural line impressed on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas.

(8) *Perennial*. The term *perennial* means surface water flowing continuously year-round.

(9) *Prior converted cropland*. The term *prior converted cropland* means any area that, prior to December 23, 1985, was drained or otherwise manipulated for the purpose, or having the effect, of making production of an agricultural product possible. EPA and the Corps will recognize designations of prior converted cropland made by the Secretary of Agriculture. An area is no longer considered *prior converted cropland* for purposes of the Clean Water Act when the area is abandoned and has reverted to wetlands, as defined in paragraph (c)(16) of this section. Abandonment occurs when prior converted cropland is not used for, or in support of, agricultural purposes at least once in the immediately preceding five years. For the purposes of the Clean Water Act, the EPA Administrator shall have the final authority to determine whether prior converted cropland has been abandoned.

(10) *Snowpack*. The term *snowpack* means layers of snow that accumulate over extended periods of time in certain geographic regions or at high elevation (*e.g.*, in northern climes or mountainous regions).

(11) *Tidal waters* and *waters subject to the ebb and flow of the tide*. The terms *tidal waters* and *waters subject to the ebb and flow of the tide* mean those waters that rise and fall in a predictable and measurable rhythm or cycle due to the gravitational pulls of the moon and sun. Tidal waters and waters subject to the ebb and flow of the tide end where the rise and fall of the water surface can no longer be practically measured in a predictable rhythm due to masking by hydrologic, wind, or other effects.

(12) *Tributary*. The term *tributary* means a river, stream, or similar naturally occurring surface water channel that contributes surface water flow to a water identified in paragraph (a)(1) of this section in a typical year either directly or through one or more waters identified in paragraph (a)(2), (3), or (4) of this section. A tributary must be perennial or intermittent in a typical year. The alteration or relocation of a tributary does not modify its jurisdictional status as long as it continues to satisfy the flow conditions of this definition. A tributary does not lose its jurisdictional status if it contributes surface water flow to a downstream jurisdictional water in a typical year through a channelized non-jurisdictional surface water feature, through a subterranean river, through a culvert, dam, tunnel, or similar artificial feature, or through a debris pile, boulder field, or similar natural feature. The term *tributary* includes a ditch that either relocates a tributary, is constructed in a tributary, or is constructed in an adjacent wetland as long as the ditch satisfies the flow conditions of this definition.

(13) *Typical year*. The term *typical year* means when precipitation and other climatic variables are within the normal periodic range (*e.g.*, seasonally, annually) for the geographic area of the applicable aquatic resource based on a rolling thirty-year period.

(14) *Upland*. The term *upland* means any land area that under normal circumstances does not satisfy all three wetland factors (*i.e.*, hydrology, hydrophytic vegetation, hydric soils) identified in paragraph (c)(16) of this section, and does not lie below the ordinary high water mark or the high tide line of a jurisdictional water.

(15) *Waste treatment system*. The term *waste treatment system* includes all components, including lagoons and treatment ponds (such as settling or cooling ponds), designed to either convey or retain, concentrate, settle, reduce, or remove pollutants, either actively or passively, from wastewater prior to discharge (or eliminating any such discharge).

(16) *Wetlands*. The term *wetlands* means areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas.

The Corps determines areas that qualify as wetlands through the use of regional delineation manuals. Under normal circumstances, three indicators of wetlands must be present, hydric soils, hydrophytic vegetation, and wetland hydrology in order for an area to qualify as a wetland. (Environmental Laboratory 1987).

The limits of jurisdiction are identified in 33 CFR 328.4 as:

(a) *Territorial Seas*. The limit of jurisdiction in the territorial seas is measured from the baseline in a seaward direction a distance of three nautical miles. (See 33 CFR 329.12)

(b) *Tidal Waters of the United States*. The landward limits of jurisdiction in tidal waters:

(1) Extends to the high tide line, or

(2) When adjacent non-tidal waters of the United States are present, the jurisdiction extends to the limits identified in paragraph (c) of this section.

(c) *Non-Tidal Waters of the United States*. The limits of jurisdiction in non-tidal waters:

(1) In the absence of adjacent wetlands, the jurisdiction extends to the ordinary high water mark, or

(2) When adjacent wetlands are present, the jurisdiction extends beyond the ordinary high water mark to the limit of the adjacent wetlands.

(3) When the water of the United States consists only of wetlands the jurisdiction extends to the limit of the wetland.

Section 401 of the CWA gives the state authority to grant, deny, or waive certification of proposed federally licensed or permitted activities resulting in discharge to waters of the U.S. The State Water Resources Control Board directly regulates multi-regional projects and supports the Section 401 certification and wetlands program statewide. The Regional Water Quality Control Boards regulate activities pursuant to Section 401(a)(1) of the federal CWA, which specifies that certification from the State is required for any applicant requesting a federal license or permit to conduct any activity including but not limited to the construction or operation of facilities that may result in any discharge into navigable waters. The certification shall originate from the State or appropriate interstate water pollution control agency in/where the discharge originates or will originate. Any such discharge will comply with the applicable provisions of Sections 301, 302, 303, 306, and 307 of the CWA.

3.3 Waters of the State

In accordance with the Porter-Cologne Water Quality Control Act, the State and Regional Water Boards are authorized to regulate discharges of waste, which includes discharges of dredged or fill material, that may affect waters of the state. “Waters of the state” include all waters of the United States. In 2000, the State Water Resources Control Board determined that all waters of the United States are also waters of the state by regulation, before any regulatory or judicial limitations on the federal definition of waters of the United States (California Code of Regulations Title 23,

Section 3831(w)). This regulation has remained in effect despite subsequent changes to the federal definition. Therefore, waters of the state include all of the following:

- Features determined by EPA or USACE to be "waters of the United States" in an approved jurisdictional determination.
- Waters of the United States upon which a USACE permitting decision was based.
- Features consistent with any current or historic final judicial interpretation of waters of the United States or any current or historic federal regulation defining waters of the United States under the federal CWA.

The State Board adopted the following state wetland definition which became effective in 2020:

> *An area is wetland if, under normal circumstances, (1) the area has continuous or recurrent saturation of the upper substrate caused by groundwater, or shallow surface water, or both; (2) the duration of such saturation is sufficient to cause anaerobic conditions in the upper substrate; and (3) the area's vegetation is dominated by hydrophytes or the area lacks vegetation.*

At the same time, the State Board adopted the following definition of waters of the state:

1. Natural wetlands,
2. Wetlands created by modification of a surface water of the state, and
3. Artificial wetlands that meet any of the following criteria:
    a. Approved by an agency as compensatory mitigation for impacts to other waters of the state, except where the approving agency explicitly identifies the mitigation as being of limited duration;
    b. Specifically identified in a water quality control plan as a wetland or other water of the state;
    c. Resulted from historic human activity, is not subject to ongoing operation and maintenance, and has become a relatively permanent part of the natural landscape; or
    d. Greater than or equal to one acre in size, unless the artificial wetland was constructed, and is currently used and maintained, primarily for one or more of the following purposes (i.e., the following artificial wetlands are not waters of the state unless they also satisfy the criteria set forth in 2, 3a, or 3b):
        i. Industrial or municipal wastewater treatment or disposal,
        ii. Settling of sediment,
        iii. Detention, retention, infiltration, or treatment of stormwater runoff and other pollutants or runoff subject to regulation under a municipal, construction, or industrial stormwater permitting program,
        iv. Treatment of surface waters,
        v. Agricultural crop irrigation or stock watering,
        vi. Fire suppression,
        vii. Industrial processing or cooling,

viii. Active surface mining – even if the site is managed for interim wetlands functions and values,

ix. Log storage,

x. Treatment, storage, or distribution of recycled water, or

xi. Maximizing groundwater recharge (this does not include wetlands that have incidental groundwater recharge benefits); or

xii. Fields flooded for rice growing.

All artificial wetlands that are less than an acre in size and do not satisfy the criteria set forth in 2, 3.a, 3.b, or 3.c are not waters of the state. If an aquatic feature meets the wetland definition, the burden is on the applicant to demonstrate that the wetland is not a water of the state.

CHAPTER 4
Setting

4.1 Project Area

The project area is in the Sacramento Valley in an urbanized region, although the project area contains relatively little development. The project area is almost entirely within the floodplain of the American River, with the River along the southern and eastern edges. The central feature within the project area is a lagoon to the side of the main channel of the River. There is often surface flow from the River both into and out of the lagoon. When the River is low there is no surface connection, although there may still be a subsurface connection.

Much of the project area, including the lagoon, has experienced extensive past disturbance. Early topographic maps (USGS 2021) indicate there was a high-water overflow channel in approximately the current location of the lagoon. There was gravel mining in the area for from approximately the 1950's to the 1970's. Topographic maps from 1950 and 1954 are labeled with "gravel pits" or "tailings". Gravel and aggregate sorting machinery and activity are visible on aerial photographs from 1952 and 1971 (UCSB 2021).

Gravel mining is not evident on aerial photographs after approximately 1981 (UCSB 2021). Since that time vegetation has re-grown in much of the project area, and many areas are not covered with woody trees and shrubs. Some areas that still experience fast currents during times of high water are scoured and have less dense vegetation and more exposed cobble and gravel.

The project area includes limited areas of development, mostly related to recreational uses. There is a paved driveway from the end of Harrington Way into a parking lot on the west side of the project area. There is a paved bicycle trail along much of the north side of the project area. The northernmost tip of the project area is a mostly dirt road into William Pond Recreation Area ending near Arden Way.

The climate in the region consists of cool, wet winters and hot, dry summers. The mean annual precipitation in Sacramento is 20.27 inches and temperatures range from a mean annual maximum of 73.1 degrees Fahrenheit to an average minimum temperature of 49.8 degrees Fahrenheit (Western Regional Climate Center 2021, NWSFO 2021). Precipitation from July 1, 2020 through January 21, 2021 (day of fieldwork) totaled 2.68 inches, which is 27% of the average accumulated precipitation for that period (NWSFO, 2019). The project area was experiencing a much drier than normal wet season at the time of fieldwork.

4.2 Soils

A custom soil resource report for the project area was generated (**Appendix B)**. The soil report identifies two map units other than water in the project area: xerofluvents, 0 to 2 percent slopes, flooded, and Rossmoor-urban land complex, 0 to 2 percent slopes. Nearly all of the project area outside of water is mapped as xerofluvents. A brief description of the primary soils within each map unit is provided below (NRCS 1993, 2021a). All colors refer to moist soil. All of the map units have major or minor components on the national hydric soils list where the necessary landform occurs (floodplains or channels; NRCS 2021b).

Xerofluvents, 0–2% slopes. These are soils formed in alluvium from mixed rocks and occur on low floodplains. They are very deep and excessively- to well-drained. Native vegetation is typically oaks and other hardwoods with annual grasses and forbs, with riparian vegetation along drainageways. They are occasionally to frequently flooded in the winter and spring and may be channeled by small drainageways formed during high water.

Rossmoor fine sandy loam, 0–2% slopes. Rossmoor soils formed in alluvium from mixed rocks and occur on high floodplains. They are very deep and well-drained. Native vegetation is typically valley oaks with annual grasses and forbs. Flooding is rare due to protection from levees and upstream dams. A typical profile has:

0–29 inches	Dark brown (10YR 3/3) neutral fine sandy loam.
29–62 inches	Dark yellowish brown (10YR 3/4) neutral fine sandy loam.

Urban land. This consists of areas covered by impervious surfaces. The substrate is similar to Rossmoor soils, but may have been altered.

4.3 Hydrology

The project area is in the watershed of the American River (HUC 1802011102). The project area is in the floodplain, and water either drains directly to the American River, or accumulates in small depressions within the old pits and mine tailings. Lower areas of the mine tailings are well-drained, and generally do not appear to contain surface water except when the American River is very high, based on aerial photographs and on-site vegetation. Base flood elevations have been determined for the project area (FEMA 2021, **Appendix C**). The navigable reach of the American River, as defined by the Corps (2021), begins in the project area near the point at which the lagoon drains into the American River. The River downstream of that point is a navigable water.

4.4 Vegetation

Plant communities are assemblages of plant species that occur together in the same area, and are defined by species composition and relative abundance. Forests and woodlands in the upland areas of the project area are largely dominated by native oaks (*Quercus lobata*, *Q. agrifolia*). The forest and woodland areas just above the OHWM have riparian trees similar to the forested wetlands described in Chapter 5.1. Some nonnative or invasive trees are present, including blue

gum (*Eucalyptus globulus*) and tree-of-heaven (*Ailanthus altissima*). The most common understory plant in the shrub layer is invasive Himalayan blackberry (*Rubus armeniacus*). Herbaceous areas in the open are mostly dominated by nonnatives including bromes (*Bromus* spp.), clovers (*Trifolium* spp.), yellow star-thistle (*Centaurea solstitialis*), and summer mustard (*Hirschfeldia incana*). Some patches of the native perennial grass creeping wildrye (*Elymus triticoides*) are present. Photographs are in **Appendix D**.

CHAPTER 5
Results

5.1 Aquatic Resources

The aquatic resources delineation identified approximately 80.185 acres of aquatic resources within the project area. Aquatic resources were classified using the *Classification of Wetlands and Deepwater Habitats of the United States* ("Cowardin Classification") (FGDC 2013). Details are provided in **Table 1** and described below. **Figure 5-1** shows the location and extent of the aquatic resources. The Aquatic Resources Spreadsheet is in **Appendix E**.

TABLE 1
AQUATIC RESOURCES

Aquatic Resource (Map ID)	Cowardin Classification	Acres (linear feet)
Other Waters		
American River	Main Channel: (Riverine, Lower Perennial, Unconsolidated Bottom, Permanently Flooded, R2UBH) Lagoon: (Palustrine, Unconsolidated Bottom, semi-permanently flooded, excavated, PUBFx)	59.961 (5,953)[1]
	Waters Total:	**59.961 (5,953)**
Wetlands		
Forested Wetland (FW1 – FW7)	Palustrine, Forested, Seasonally Flooded, Excavated (PFOCx)	17.487
Scrub-Shrub Wetland (SS1 – SS9)	Palustrine, Scrub-shrub, Seasonally Flooded, Excavated (PSSCx)	2.113
Emergent Wetland (EW1 – EW5)	Palustrine, Emergent, Persistent, Seasonally Flooded, Excavated (PEM1Cx)	0.624
	Wetland Total:	**20.224**
	Grand Total:	**80.185 (5,953)**

[1] Linear feet for the American River was measured along the approximate centerline of the main stem of the channel, not through the lagoon.

SOURCE: ESA 2021

5.1.1 Waters

American River

The American River is a perennial watercourse. The bed in the project area consists of substrate ranging in size from mud to cobble. OHWM indicators in the field approximately matched the location of the 18,500 cfs flow elevation (Appendix D, photo 3), and that elevation was used to delineate the OHWM boundary. The main channel of the American River bends around the eastern and southern sides of the project area. The project area boundary is near the centerline of the main channel. A perennial lagoon is off to the side of the main channel. Surface water flows into and out of the lagoon on either end at low areas of scoured cobble. Most of the lagoon contains water year-round. The inflow and outflow areas are exposed when water is low.

Most of the river is unvegetated, or has sparse submerged or aquatic floating vegetation along the margins including invasive water primrose (OBL; *Ludwigia* sp.). Areas below the 18,500 cfs OHWM elevation with at least 5 percent vegetation cover are identified as wetlands below the OHWM and are discussed below.

5.1.2 Wetlands

Forested Wetland

Vegetated areas dominated by mature trees below the OHWM of the American River are mapped as forested wetlands (FW 1 through 7). Soils consist of alluvium, with sandy soils or mud present in many locations. The forested wetland floods on average at least once every two years based on its position below the OHWM (18,500 cfs flow elevation). The forested wetland has a plant community dominated by riparian trees including Fremont cottonwood (FAC; *Populus fremontii* ssp. *fremontii*), box elder (FACW; *Acer negundo* var. *californicum*), Oregon ash (FACW; *Fraxinus latifolia*), and white alder (FACW; *Alnus rhombifolia*). Much of the forested wetland has a well-developed understory/shrub layer dominated by willows (FACW; *Salix* spp.), invasive Himalayan blackberry (FAC), and California rose (FAC; *Rosa californica*). Nutsedge (FACW; *Cyperus eragrostis*) and curly dock (FAC; *Rumex* spp.) are common in the herb layer.

Scrub-Shrub Wetland

Vegetated areas dominated by shrubs or sparse or immature trees below the OHWM of the American River are mapped as scrub-shrub wetlands (SS 1 through 9). The substrate in the scrub-shrub wetland often consists of cobble, gravel, or sand with little or no soil. The scrub-shrub wetland appears to be subjected to faster currents when water is high, and may be inundated more frequently than the forested wetland. Much of the scrub-shrub wetland is dominated by sandbar willow (FACW; *Salix exigua*). Tree and shrub species similar to the forested wetland also occur, but are generally less abundant and smaller in size than in the forested wetland. The herb layer is often absent or poorly developed, and often scoured cobble or gravel is present.

Figure 5-1b
Aquatic Resources Delineation Map

Emergent Wetland

Emergent wetland is dominated by perennial aquatic emergent vegetation and annual hydrophytic forbs. There are two areas of emergent wetland below the OHWM of the American River (EW 1 and 3) and three much smaller emergent wetlands in low areas among the old mine tailings (EW 2, 4, and 5). Soils are typically sandy loams, often underlain by cobble at approximately 8 inches deep. Soils met the redox dark surface or redox depressions indicators. Hydrology is provided by either flooding from the American River, or from runoff from surrounding uplands for the small emergent wetlands amongst the mine tailings. Vegetation is typically dominated by spikerush (OBL; *Eleocharis macrostachya*), rushes (mostly FACW; *Juncus* spp.), or vervain (FACW; *Verbena bonariensis*). The emergent wetland on the north side of the lagoon is disturbed by frequent foot traffic and has compacted soils.

5.2 Regulatory Analysis

5.2.1 Waters of the U.S.

After the aquatic resources were delineated, all features were evaluated to determine whether they may be regulated under the CWA, using the parameters set forth under the current regulations defining waters of the U.S. **Table 2** summarizes the results of this assessment for all aquatic resources in the project area.

TABLE 2
APPLICATION OF THE "WATERS OF THE UNITED STATES" DEFINITION TO AQUATIC RESOURCES

Aquatic Resource	Waters of the U.S. (acres)	Excluded (acres)	Rationale
Other Waters			
American River	59.961	—	Downstream portion is a navigable water (33 CFR 328.3(a)(1)). Upstream portion is a tributary (33 CFR 328.3(a)(2)).
Wetlands			
Forested Wetlands 1–7	17.487	—	Adjacent wetlands (33 CFR 328.3(a)(4)).
Scrub-Shrub Wetlands 1–9	2.113	—	Adjacent wetlands (33 CFR 328.3(a)(4)).
Emergent Wetlands 1 and 3	0.617	—	Adjacent wetlands (33 CFR 328.3(a)(4)).
Emergent Wetlands 2, 4, and 5	—	0.007	Features not identified as waters of the U.S. (33 CFR 328.3(b)(1)). Do not meet definition of adjacent wetlands (33 CFR 328.3(c)(1)).
Total:	**80.178**	**0.007**	

American River

Part of the American River in the project area is defined as a navigable water by the Sacramento District of the Corps (2021). The approximate upper limit of navigability is noted on Figure 5-1a. Navigable waterways that were, are, or may be used in interstate or foreign commerce are waters of the U.S. (33 CFR 328.3(a)(1)).

Upstream of the defined limit of navigability, the American River qualifies as a tributary because it contributes surface water flow to the navigable portion of the American River every year. Tributaries are waters of the U.S. (33 CFR 328.3(a)(2)).

Forested Wetlands (FW 1 through 7), Scrub-Shrub Wetlands (SS 1 through 9), and Emergent Wetlands (EW 1 and 3)

These wetlands are below the OHWM of the American River. These wetlands abut the American River, and therefore meet the definition of adjacent wetlands (33 CFR 328.3(c)(1)(i)). Adjacent wetlands are waters of the U.S. (33 CFR 328.3(a)(4)).

Emergent Wetlands (EW 2, 4, and 5)

These wetlands are in low spots of topography amongst old mine tailings. They are surrounded by much higher terrain, mostly more than 10 feet higher in elevation. The areas draining to them are large enough to result in small areas (32 to 160 ft^2) of wetland conditions, as they appear to have similar well-drained substrates as the rest of the mine tailings areas. These wetlands are much too small, and the surrounding terrain too high, to ever overtop into the American River. The water in the American River would need to rise well beyond the elevation of a typical year before water would enter these emergent wetlands, because the OHWM as mapped is approximately a 2-year flood event. These emergent wetlands do not abut the American River, are not inundated by the American River in a typical year, and are not physically separated from the American River by a natural feature. Therefore, they do not meet the definition of adjacent wetlands (33 CFR 328.3(c)(1)). Aquatic resources not identified in 33 CFR 328.3(a) are not waters of the U.S. (33 CFR 328.3(b)(1)). EW 2, 4, and 5 might also qualify as pits excavated in uplands incidental to mining activity for the purpose of obtaining gravel (33 CFR 328.3(b)(9)).

5.2.2 Waters of the State

All of the aquatic resources in the project area that qualify as waters of U.S also qualify as waters of the state.

EW 2, 4, and 5 may not qualify as waters of the U.S. Waters of the state include “wetlands created by modification of a surface water of the state” (Item 2) and artificial wetlands that “resulted from historic human activity, is not subject to ongoing operation and maintenance, and has become a relatively permanent part of the natural landscape” (Item 3c). There were overflow channels of the American River in the vicinity of EW 2, 4, and 5 prior to gravel mining in the area. EW 2, 4, and 5 could also be considered artificial wetlands resulting from the gravel mining, not subject to ongoing operation and maintenance, that have become a relatively permanent part of the natural landscape. EW 2, 4, and 5 will likely qualify as waters of the state based on the State Board’s procedures.

5.3 Conclusions

In total, 80.185 acres of aquatic resources are present in the project area. All of the aquatic resources that meet criteria as waters of the U.S. total 80.178 acres. The aquatic resources that may not qualify as waters of the U.S. (EW 2, 4, and 5) total 0.007 acre.

The entire 80.185 acres of aquatic resources in the project area may qualify as waters of the state.

This report documents the delineation of the boundaries of aquatic resources in the project area, based on the best professional judgment of ESA investigators. All conclusions presented should be considered preliminary and subject to change pending review by the Corps and/or State of California.

Appendix A

Wetland Determination Data Forms

WETLAND DETERMINATION DATA FORM – Arid West Region
Routine Wetland Determination
(September 2008 V2.0 COE Arid West Wetlands Delineation Manual)

Project/Site: Lower American River – Arden Pond City/County: Sacramento County Sampling Date: January 21, 2021
Applicant/Owner: SAFCA State: CA Sampling Point: **1**
Investigator(s): Chuck Hughes, Kelly Bayne Section, Township, Range: See Report
Landform (hillslope, terrace, etc.): Floodplain Local relief (concave, convex, none): Concave Slope (%): <1
Subregion (LRR): C Lat: See Report Long: Datum:
Soil Map Unit Name: Xerofluvents, 0-2% slopes, flooded NWI classification: None
Are climatic/hydrologic conditions on the site typical for this time of the year? Yes ☐ No ☒ (If no, explain in remarks.)
Are Vegetation ☐ Soil ☐, Or Hydrology ☐ significantly disturbed? Are "Normal Circumstances" present? Yes ☒ No ☐
Are Vegetation ☐ Soil ☐, Or Hydrology ☐ Naturally problematic? (If needed, explain any answers in remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes ☐	No ☒			
Hydric Soil Present?	Yes ☐	No ☒	Is the Sampled Area		
Wetland Hydrology Present?	Yes ☐	No ☒	within a Wetland?	Yes ☐	No ☒

Remarks: Winter has been drier than normal. Data point taken in low spot in topography.

WETLAND DETERMINATION DATA FORM – Arid West Region
Routine Wetland Determination
(September 2008 V2.0 COE Arid West Wetlands Delineation Manual)

Project/Site: Lower American River – Arden Pond City/County: Sacramento County Sampling Date: January 21, 2021
Applicant/Owner: SAFCA State: CA Sampling Point: **8**
Investigator(s): Chuck Hughes, Kelly Bayne Section, Township, Range: See Report
Landform (hillslope, terrace, etc.): Floodplain Local relief (concave, convex, none): Concave Slope (%): 1
Subregion (LRR): C Lat: See Report Long: Datum:
Soil Map Unit Name: Xerofluvents, 0-2% slopes, flooded NWI classification: None
Are climatic/hydrologic conditions on the site typical for this time of the year? Yes ☐ No ☒ (If no, explain in remarks.)
Are Vegetation ☐ Soil ☐, Or Hydrology ☐ significantly disturbed? Are "Normal Circumstances" present? Yes ☒ No ☐
Are Vegetation ☐ Soil ☐, Or Hydrology ☐ Naturally problematic? (If needed, explain any answers in remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes ☐	No ☒	
Hydric Soil Present?	Yes ☐	No ☒	Is the Sampled Area
Wetland Hydrology Present?	Yes ☐	No ☒	within a Wetland? Yes ☐ No ☒

Remarks: Winter has been drier than normal. Occasional flooding in this area likely from topography and proximity of lagoon.

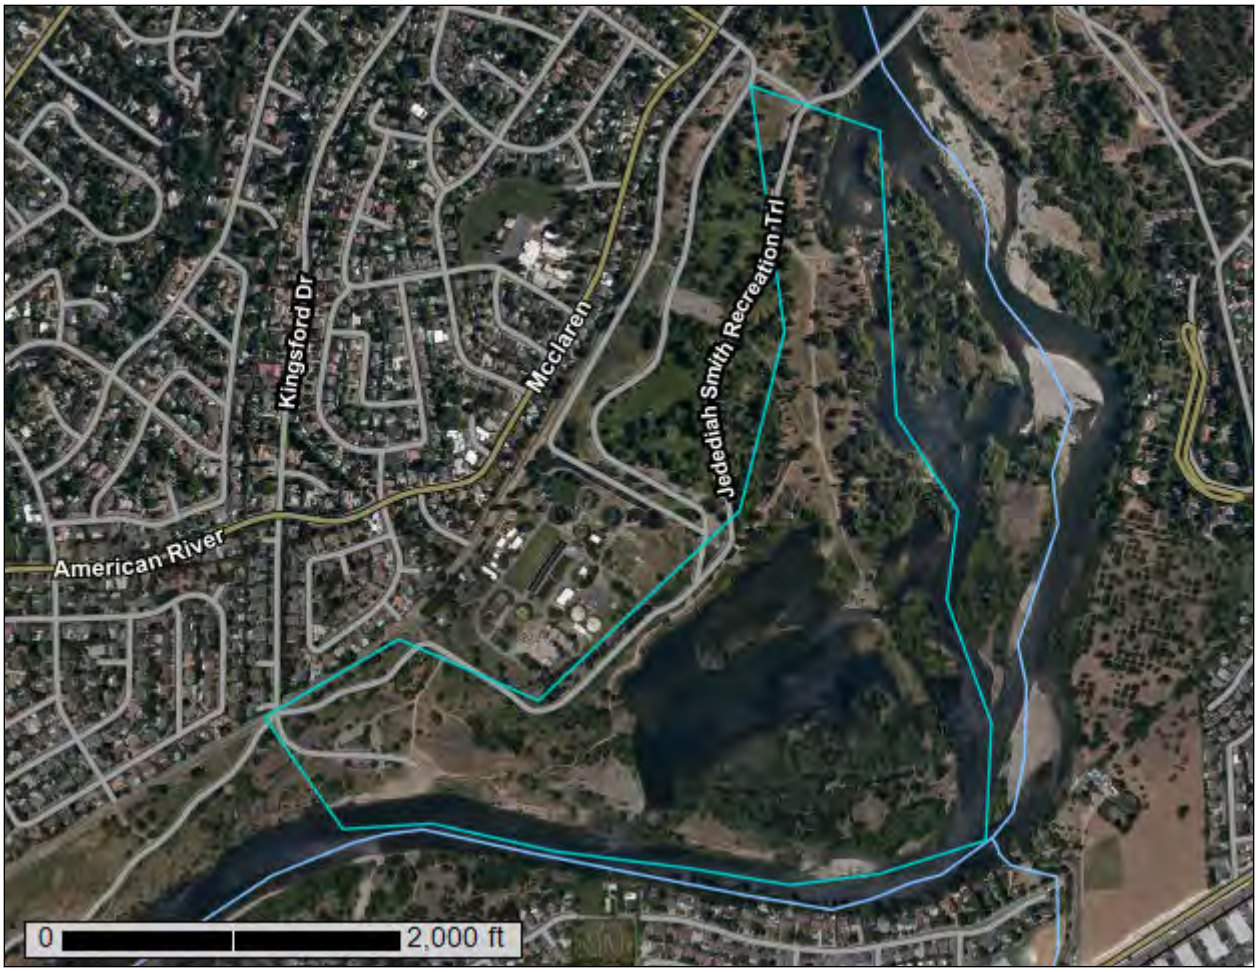
Appendix B
Custom Soil Resource Report

United States Department of Agriculture

Natural Resources Conservation Service

A product of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local participants

Custom Soil Resource Report for Sacramento County, California



February 11, 2021

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require

alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

How Soil Surveys Are Made

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Sacramento County, California
Survey Area Data: Version 19, May 29, 2020

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: May 12, 2019—Jun 1, 2019

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

247	Water	16.0	8.8%
Totals for Area of Interest		**181.0**	**100.0%**

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The

delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Sacramento County, California

205—Rossmoor-Urban land complex, 0 to 2 percent slopes

Map Unit Setting

National map unit symbol: hhpl
Elevation: 30 to 110 feet
Mean annual precipitation: 20 inches
Mean annual air temperature: 61 degrees F
Frost-free period: 275 to 300 days
Farmland classification: Not prime farmland

Map Unit Composition

Rossmoor and similar soils: 55 percent
Urban land: 30 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Rossmoor

Setting

Landform: Flood plains
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium

Typical profile

H1 - 0 to 6 inches: fine sandy loam
H2 - 6 to 62 inches: fine sandy loam

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Runoff class: Very low
Capacity of the most limiting layer to transmit water (Ksat): High (1.98 to 5.95 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: Rare
Frequency of ponding: None
Available water capacity: Moderate (about 7.8 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 3c
Hydrologic Soil Group: A
Hydric soil rating: No

Description of Urban Land

Typical profile

H1 - 0 to 6 inches: variable

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 8
Hydric soil rating: No

Minor Components

Columbia

Percent of map unit: 6 percent
Landform: Flood plains
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Hydric soil rating: Yes

Americanos

Percent of map unit: 5 percent
Hydric soil rating: No

Unnamed, unloamy sandamed

Percent of map unit: 2 percent
Hydric soil rating: No

Unnamed, gravelly substratum

Percent of map unit: 2 percent
Hydric soil rating: No

242—Xerofluvents, 0 to 2 percent slopes, flooded

Map Unit Setting

National map unit symbol: hhqs
Elevation: 20 to 140 feet
Mean annual precipitation: 14 inches
Mean annual air temperature: 61 degrees F
Frost-free period: 250 to 300 days
Farmland classification: Not prime farmland

Map Unit Composition

Xerofluvents and similar soils: 90 percent
Minor components: 10 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Xerofluvents

Setting

Landform: Flood plains
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium

Typical profile

H1 - 0 to 60 inches: variable

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Somewhat excessively drained
Runoff class: Very low
Depth to water table: More than 80 inches
Frequency of flooding: NoneOccasional
Frequency of ponding: None

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 6w
Hydric soil rating: Yes

Minor Components

Riverwash

Percent of map unit: 4 percent
Landform: Channels
Hydric soil rating: Yes

Rossmoor

Percent of map unit: 3 percent
Hydric soil rating: No

Xerorthents

Percent of map unit: 3 percent
Hydric soil rating: No

247—Water

Map Unit Composition

Water: 100 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Appendix C

FEMA Flood Insurance Rate Map

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations tables in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations tables should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures for this jurisdiction.

The **projection** used in the preparation of this map was California State Plane Zone II (FIPSZONE 0402). The **horizontal datum** was NAD 83, GRS80 spheroid. Differences in datum, spheroid, projection or State Plane zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

NGS Information Services
NOAA, N/NGS12
National Geodetic Survey
SSMC-3, #9202
1315 East-West Highway
Silver Spring, Maryland 20910-3282
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit its website at http://www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Sacramento Water Resources Department. This information was derived from digital orthophotos produced with 6-inch pixel resolution and 3.3-foot horizontal accuracy from aerial photography dated March 2001.

This map may reflect more detailed and up-to-date **stream channel configurations** than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study Report (which contains authoritative hydraulic data) may reflect stream channel distances that differ from what is shown on this map.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

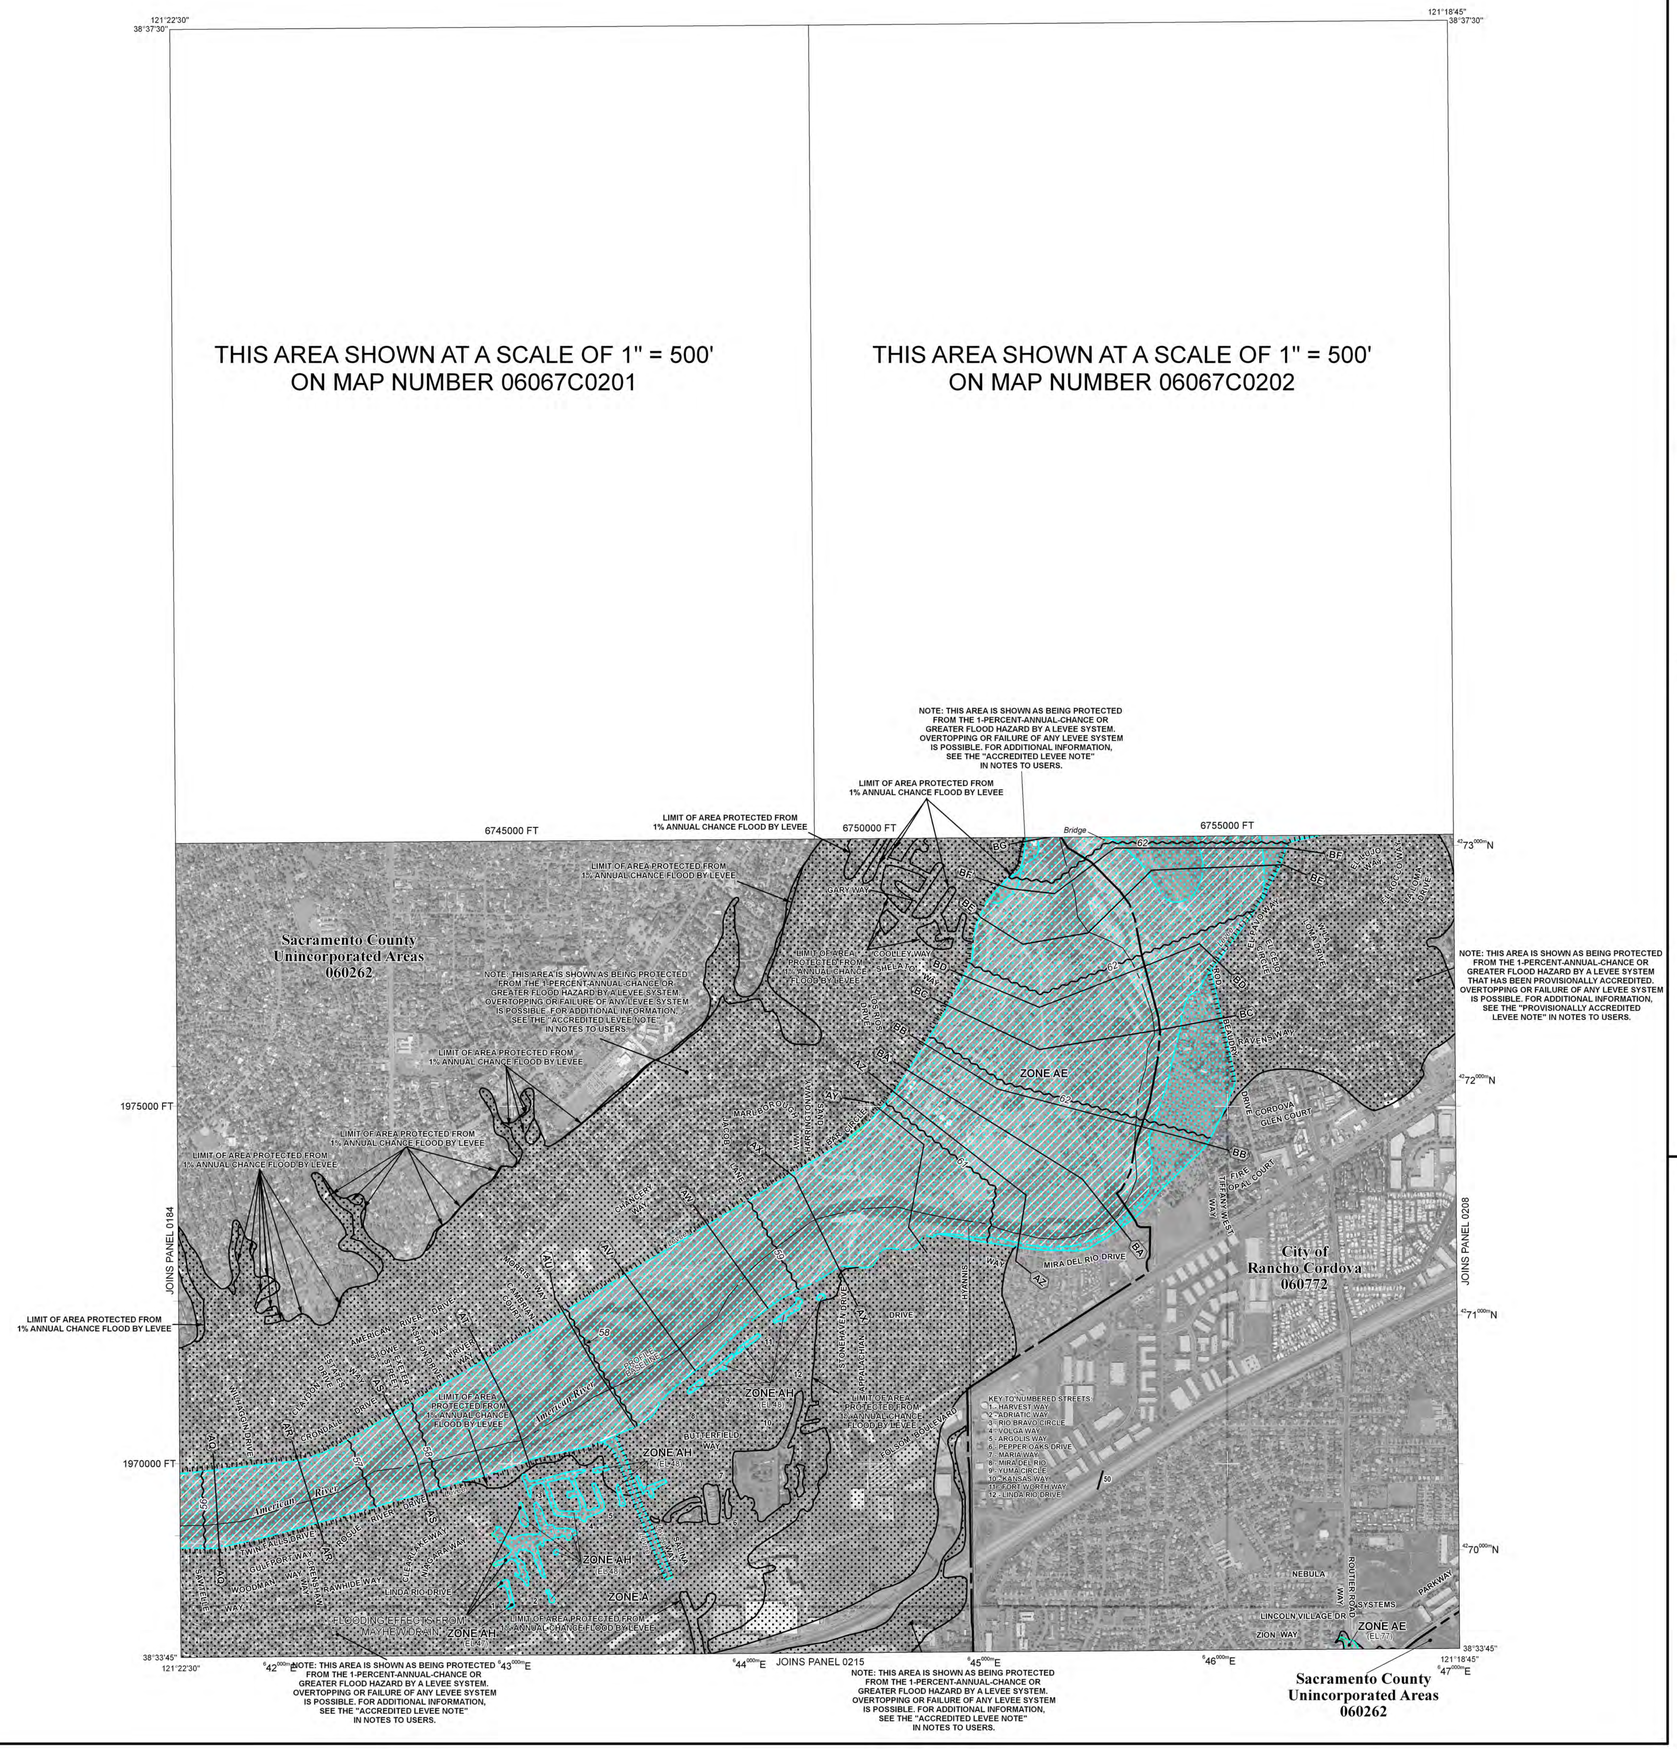
Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

For information on available products associated with this FIRM visit the **Map Service Center (MSC)** website at http://msc.fema.gov. Available products may include previously issued Letters of Map Change, a Flood Insurance Study Report, and/or digital versions of this map. Many of these products can be ordered or obtained directly from the MSC website.

If you have **questions about this map**, how to order products or the National Flood Insurance Program in general, please call the FEMA Map Information eXchange (FMIX) at **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip.

Accredited Levee Notes to Users: Check with your local community to obtain more information, such as the estimated level of protection provided (which may exceed the 1-percent-annual-chance level) and Emergency Action Plan, on the levee system(s) shown as providing protection for areas on this panel. To mitigate flood risk in residual risk areas, property owners and residents are encouraged to consider flood insurance and floodproofing or other protective measures. For more information on flood insurance, interested parties should visit the FEMA Website at http://www.fema.gov/business/nfip/index.shtm.

Provisionally Accredited Levee Notes to Users: Check with your local community to obtain more information, such as the estimated level of protection provided (which may exceed the 1-percent-annual-chance level) and Emergency Action Plan, on the levee system(s) shown as providing protection for areas on this panel. To maintain accreditation, the levee owner or community is required to submit the data and documentation necessary to comply with Section 65.10 of the NFIP regulations by January 26, 2011. If the community or owner does not provide the necessary data and documentation or if the data and documentation provided indicate the levee system does not comply with Section 65.10 requirements, FEMA will revise the flood hazard and risk information for this area to reflect de-accreditation of the levee system. To mitigate flood risk in residual risk areas, property owners and residents are encouraged to consider flood insurance and floodproofing or other protective measures. For more information on flood insurance, interested parties should visit the FEMA website at http://www.fema.gov/business/nfip/index.shtm.



LEGEND

SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No Base Flood Elevations determined.
ZONE AE	Base Flood Elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Special Flood Hazard Area formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.
ZONE A99	Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

ZONE X — Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

ZONE X — Areas determined to be outside the 0.2% annual chance floodplain.

ZONE D — Areas in which flood hazards are undetermined, but possible.

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

1% annual chance floodplain boundary

0.2% annual chance floodplain boundary

Floodway boundary

Zone D boundary

CBRS and OPA boundary

Boundary dividing Special Flood Hazard Area Zones and boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths or flood velocities.

Appendix D
Photographs

Photograph 1
View of a typical upland area dominated by nonnatives, mostly grasses.

Photograph 2
View looking north of an open understory area of upland riparian forest. The shovel is at data point 11. In the background there is a slope, the grade drops over 5 feet to below the OHWM, and the area was mapped as forested wetland.

Photograph 3

View looking upstream along the American River. The grassy area in the foreground and on the left is above the OHWM. The scoured, gravelly area is below the OHWM.

Photograph 4

View southwest of the area where surface flow from the mainstem American River enters the lagoon area. This area was mapped below OHWM.

Photograph 5
View of forested wetland. Much of the forested wetland is very thickly vegetated in the understory.

Photograph 6
The low depression is emergent wetland 1. Although degraded by foot traffic, perennial wetland vegetation such as Baltic rush and spikerush is common. Forested wetland 6 is in the background.

Photograph 7

View of emergent wetland 5, a small depression in old dredge tailings dominated by spikerush, which had not started growing yet during the January fieldwork. The shovel is at data point 4.

Appendix D

Standard Assessment Methodology Analysis for Subreaches 1, 2, 3, and 4 Including Arden Pond

D1 Fisheries Resources Assessment – Standard Assessment Methodology for Subreach 2

Appendix D1

Fisheries Resources Assessment - Standard Assessment Methodology (SAM) for Subreach 2

2.1 Methods

The Standard Assessment Methodology (SAM) characterizes fish habitat using six variables: (1) bank slope, (2) floodplain inundation ratio, (3) bank substrate size, (4) instream structure, (5) aquatic vegetation, and (6) overhanging shade. These six habitat variables were characterized according to the SAM documentation (USACE 2012) and the application of SAM for the 2015 National Marine Fisheries Service (NMFS) Biological Opinion of the American River Common Features General Reevaluation Report (ARCF GRR; NMFS 2015). Northwest Hydraulic Consultants provided the segment boundaries, channel centerline, average Summer/Fall shoreline (2,660 cfs), average Winter/Spring shoreline (3,900 cfs), 2-year flood probability shoreline (18,500 cfs), and a topographic digital elevation model (DEM).

For SAM variables characterized using GIS, ESRI ArcGIS version 10.4 software was used. For SAM variables characterized using field assessment, surveys were conducted during the interval from September 10 to 24, 2018 using the ESRI ArcGIS Collector version 18.0.2 mobile application on an iPad connected via Bluetooth to a Trimble R1 submeter-accuracy external global positioning system (GPS) receiver. Field surveys used a customized Collector map with capabilities to hand draw and attribute features over aerial imagery in the field, as well as use the Trimble R1 to track the surveyor's location. SAM variables were characterized at the two seasonal shorelines (average Summer/Fall and average Winter/Spring) for all Subreach 2 Tier 1 segments (Segments 2, 3, 4, 5, 16), all Tier 2 segments (Segments12, 13, 14, 15), and one Tier 3 segment (Segment 11).

2.1.1 Bank Slope

Bank slope was characterized using GIS to overlay the modeled water surface at the two seasonal average shorelines on a continuous topographic surface generated from the DEM at a 5-ft grid cell spacing. The intersection of the topographic and water surfaces corresponds to the shoreline for each season. The slope at the shoreline was calculated by obtaining a continuous slope surface within GIS from the DEM. Point estimates of the bank slope along the shoreline were averaged within each segment. Note that bank slope for SAM is reported as Δwidth/Δheight (run/rise).

2.1.2 Floodplain Inundation Ratio

Floodplain inundation ratio was characterized using GIS to generate inundation water surfaces from water surface elevation data for the average Winter/Spring shoreline and the 2-year flood probability shoreline. Water surface elevation was expressed relative to the North American Vertical Datum of 1988 (NAVD88). The inundated area for each shoreline was determined by overlaying the continuous surface at each flow with the DEM. The inundated area for the 2-year flood shoreline was divided by the inundated area for the average Winter/Spring shoreline to produce a floodplain inundation ratio for Winter/Spring. As described in the SAM documentation (USACE 2012), the floodplain inundation ratio for Summer/Fall was assumed to be 1.0.

2.1.3 Bank Substrate Size

Bank substrate size was characterized using field surveys with the Wolman pebble count method. A total of 25 sampling points were distributed evenly along each seasonal shoreline in each segment. At each sampling point the intermediate axis length of a randomly selected piece of substrate was measured to the nearest one centimeter with a one-meter long measuring stick. For sand, the median size of 0.1 cm from this category in the SAM documentation (USACE 2012, Table 5-3) was used. For silt, the median size of 0.003 cm from this category in the SAM documentation (USACE 2012, Table 5-3) was used. All measurements were converted to inches and the median size (D_{50}) was calculated for each seasonal shoreline in each segment.

2.1.4 Instream Structure

Instream structure was characterized using continuous field surveys along each seasonal shoreline. Any structure located between a seasonal shoreline and the channel centerline was hand drawn as a line feature in the ESRI ArcGIS Collector map. The composite length of all instream structure parallel to a seasonal shoreline was calculated by projecting the length of drawn lines onto the shoreline, with exclusion of overlapping structure. This composite length was then divided by the shoreline length to calculate a percent shoreline cover for each seasonal shoreline in each segment.

2.1.5 Aquatic Vegetation

Aquatic vegetation was characterized using continuous field surveys along each seasonal shoreline. Any emergent aquatic vegetation or seasonally inundated perennial vegetation located between a seasonal shoreline and the channel centerline was hand drawn as a line feature along a seasonal shoreline in the ESRI ArcGIS Collector map. The composite length of all vegetation parallel to a seasonal shoreline was calculated by projecting the length of drawn lines onto the shoreline. This composite length was then divided by the shoreline length to calculate a percent shoreline cover for each seasonal shoreline in each segment.

2.1.6 Overhanging Shade

Overhanging shade was characterized using GIS analysis of the overstory tree mapping described in the Vegetation Resources section below. Canopy cover polygons of any density were

intersected with seasonal shorelines to calculate the shaded length of a seasonal shoreline. This length was then divided by the shoreline length to calculate a percent shoreline cover for each seasonal shoreline in each segment. Values for overhanging shade at Winter and Spring habitat conditions were modified by factors of 0.25 and 0.75, respectively, to account for seasonal defoliation.

2.2 Results

Results of the SAM fisheries resources assessment are presented below in a series of tables, one per segment of Subreach 2 (**Tables 2-1** through **2-10**). The SAM survey only covered segments where construction impacts could occur, which includes segments in Tiers 1 and 2, and Segment 11 in Tier 3. These tables are in the standard format used for input to the SAM Electronic Calculation Template (ECT). Within Subreach 2, bank slope ratio ranged from 1.3 to 4.5, floodplain inundation ratio ranged from 1.0 to 1.94, median bank substrate size ranged from 0.04 to 4.5 inches, instream structure ranged from 5% to 73% shoreline cover, aquatic vegetation ranged from 19% to 100% shoreline cover, and overhanging shade for Summer/Fall ranged from 68% to 100% shoreline cover.

D2 Fisheries Resources Assessment – Standard Assessment Methodology for Subreaches 1, 3, & 4

APPENDIX D2

Fisheries Resources Assessment – Standard Assessment Methodology (SAM) for Subreaches 1, 3, & 4

1.1 Introduction

This section describes the methods and results of Standard Assessment Methodology (SAM) surveys that were conducted of the American River shorelines. SAM is a habitat index calculator and model, designed to predict habitat quality index values for shaded riverine aquatic (SRA) habitat, and assesses relative changes in habitat based on shoreline erosion protection designs. To help guide these designs, and to assess baseline SRA habitat quality a baseline SAM survey was conducted in the field in the fall of 2019, a single survey in Subreach 3 Segment 2 in winter 2020, and multiple surveys in May 2020 for Subreach 1, Segments 10 and 13, Subreach 3, Segments 1,3, 4, and 12, and Subreach 4 Segments 8-10.

1.2 Methods

SAM characterizes fish habitat using six variables: (1) bank slope, (2) floodplain inundation ratio, (3) bank substrate size, (4) instream structure, (5) aquatic vegetation, and (6) overhanging shade. These six habitat variables were characterized according to the SAM documentation (Corps 2012) and the application of SAM for the 2015 National Marine Fisheries Service (NMFS) Biological Opinion of the American River Common Features General Reevaluation Report (ARCF GRR; NMFS 2015). NHC provided the segment boundaries, channel centerline, average Summer/Fall shoreline (2,660 cfs), average Winter/Spring shoreline (3,900 cfs), 2-year flood probability shoreline (18,500 cfs), and a topographic digital elevation model (DEM).

For SAM variables calculated in GIS, ESRI ArcGIS version 10.4 software was used. For SAM variables characterized using field assessment, surveys were conducted during the interval from September 19 to October 3, 2019, February 24, 2020, and May 9 to May 19, 2020 using the ESRI ArcGIS Collector version 18.0.2 mobile application on a tablet connected via Bluetooth to a Trimble R1 submeter-accuracy external global positioning system (GPS) receiver. Field surveys used a customized web map with capabilities to hand draw and attribute features over aerial imagery in the field, as well as used the Trimble R1 to track the surveyor's location.

Surveyors were trained to use the seasonal shoreline represented on the tablet to locate the approximate location of seasonal shorelines. Errors in positioning (e.g., due to tablet GPS errors, surveyor error, or improper modeling of shorelines) were small relative to the spatial resolution of SAM (i.e., segments). Given the purpose of SAM, as a tool to assess relative changes, the use of a consistent benchmark for

measurement of variables with increased precision is more valuable than absolute accuracy of the measurements, though both accuracy and precision are the goal of this assessment. SAM variables were measured or estimated at the two seasonal shorelines (average Summer/Fall and average Winter/Spring) for nine Tier 1 segments (Subreach 1 Segments 11 and 12, Subreach 3 Segments 5,6,8, 9, and 11, and Subreach 4 Segments 1 and 3), nine Tier 2 segments (Subreach 1 Segments 2, 3, 6, and 10, and Subreach 3 Segments 1, 3, 4, 7 and 10), and four Tier 3 segment (Subreach 3 Segment 2 and 12, Subreach 4 Segments 2 and 9). In addition, five Tier 3 segments (Subreach 1 Segments 5 and 13, and Subreach 4 Segments 4, 8, and 10) were partially surveyed because they are adjacent to Tier 1 and 2 segments and the Project could impact them. The values reported for these segments represent the conditions present only along the length of shoreline sampled, and are not meant to characterize the entire segment.

Given the temporal and spatial scope of SAM analyses, certain processes (e.g., tidal influence) are not addressed within the model, therefore the absolute amount of habitat present within tidally influenced subreaches (e.g., Subreach 1) may be underrepresented during periods of high tide. However, as SAM is used to calculate relative changes between two conditions over a yearly time-step, sub-daily habitat changes are less meaningful than the large-scale structural (both biotic and abiotic) changes from erosion protection projects.

1.2.1 Bank Slope

Bank slope was characterized using GIS to overlay the modeled water surface at the two seasonal average shorelines on a continuous topographic surface generated from the DEM at a 3-ft grid cell spacing, following standard SAM methodologies (Corps 2012). The intersection of the topographic and water surfaces corresponds to the shoreline for each season. The slope at the shoreline was calculated by obtaining a continuous slope surface within GIS from the DEM. Point estimates of the bank slope along the shoreline were averaged within each segment. Note that bank slope for SAM is reported as Δwidth/Δheight (run/rise).

1.2.2 Floodplain Inundation Ratio

Floodplain inundation ratio was calculated using GIS to generate inundation water surfaces (i.e., the wetted surface area) from water surface elevation data for the average Winter/Spring shoreline and the 2-year flood probability shoreline. Water surface elevation was expressed relative to the North American Vertical Datum of 1988 (NAVD88). The wetted surface area for each shoreline was determined by overlaying the continuous surface at each flow with the DEM. Each segment's wetted surface areas were bounded by the river centerline and upstream and downstream boundaries for each segment following SAM methodology (Corps 2012). The segment's wetted surface area for the 2-year flood shoreline was divided by the wetted surface area for the average Winter/Spring shoreline to produce a floodplain inundation ratio for Winter/Spring. As described in the SAM documentation (Corps 2012), the floodplain inundation ratio for Summer/Fall was assumed to be 1.0. Mid-channel islands that were not part of the analysis were excluded to remove their impact on the floodplain inundation ratio metric, consistent with SAM methodology, which does not include islands.

1.2.3 Bank Substrate Size

Bank substrate size was characterized using field surveys with the Wolman pebble count method. Sampling points were distributed every 20 meters along each seasonal shoreline in each segment. At each sampling point the intermediate axis length of a randomly selected piece of substrate was measured to the nearest one centimeter with a one-meter long measuring stick. For sand, the median size of 0.1 cm from this category in the SAM documentation (Corps 2012, Table 5-3) was used. For silt, the median size of 0.003 cm from this category in the SAM documentation (Corps 2012, Table 5-3) was used. All measurements were converted to inches and the median size (D_{50}) was calculated for each seasonal shoreline in each segment.

1.2.4 Instream Structure

Instream structure was characterized using continuous field surveys along each seasonal shoreline. Any structure located between a seasonal shoreline and the channel centerline was hand drawn as a line feature in the ESRI ArcGIS web map. The composite length of all instream structure parallel to a seasonal shoreline was calculated by projecting the length of drawn lines onto the shoreline, with exclusion of overlapping structure. This composite length was then divided by the shoreline length to calculate a percent shoreline cover for each seasonal shoreline in each segment.

1.2.5 Aquatic Vegetation

Aquatic vegetation was characterized using continuous field surveys along each seasonal shoreline. Any aquatic vegetation located between a seasonal shoreline and the channel centerline was hand drawn as a line feature along a seasonal shoreline in the ESRI ArcGIS web map and assigned a growth form. Vegetation growth form was selected from five options – riparian woody, riparian herbaceous, aquatic emergent, aquatic floating, or aquatic submerged. The composite length of each vegetation growth form parallel to a seasonal shoreline was calculated by projecting the length of drawn lines onto the shoreline. This composite length was then divided by the shoreline length to calculate a percent shoreline cover for each vegetation growth form for each seasonal shoreline in each segment.

1.2.6 Overhanging Shade

Overhanging shade was characterized using GIS analysis of the overstory tree mapping described in the Vegetation Resources section below. Canopy cover polygons of any density were intersected with seasonal shorelines to calculate the shaded length of a seasonal shoreline. This length was then divided by the shoreline length to calculate a percent shoreline cover for each seasonal shoreline in each segment. Values for overhanging shade at Winter and Spring habitat conditions were modified by factors of 0.25 and 0.75, respectively, to account for seasonal defoliation.

1.3 Results

Results of the SAM fisheries resources assessment are presented below in a series of tables, one per surveyed segment of Subreaches 1, 3, and 4 (**Tables 2-1** through **2-27**). The SAM survey only covered segments where construction impacts could occur, which includes segments in Tiers 1, 2, and 3. These tables are in the standard format used for input to the SAM Electronic Calculation Template (ECT).

1.3.1 Subreach 1 Surveyed Segments

At Subreach 1, bank slopes were relatively steep, with instream structure somewhat lower than at the other two subreaches, and shoreline cover with a wider range of values.

Bank slope ratio ranged from 1.8 to 3.8, floodplain inundation ratio ranged from 1.0 to 1.72, median bank substrate size ranged from 0.001 to 25 inches, instream structure ranged from 1% to 32% shoreline cover, aquatic vegetation ranged from 0% to 90% shoreline cover, and overhanging shade for Summer/Fall ranged from 19% to 100% shoreline cover.

1.3.2 Subreach 3 Surveyed Segments

At Subreach 3, bank slopes covered a wide range of values, from steep to flat, with instream structure somewhat higher than at the other two subreaches, and shoreline cover being consistently high.

Bank slope ratio ranged from 1.3 to 9.2, floodplain inundation ratio ranged from 1.0 to 1.83, median bank substrate size ranged from 0.04 to 6.3 inches, instream structure ranged from 10% to 46% shoreline cover, aquatic vegetation ranged from 0% to 95% shoreline cover, and overhanging shade for Summer/Fall ranged from 13% to 100% shoreline cover.

1.3.3 Subreach 4 Surveyed Segments

At Subreach 4, bank slopes were about average, with instream structure covering a relatively wide range of values, and shoreline cover being consistently high.

Bank slope ratio ranged from 2.8 to 12.2, floodplain inundation ratio ranged from 1.0 to 2.16, median bank substrate size ranged from 0.04 to 8.5 inches, instream structure ranged from 1% to 43% shoreline cover, aquatic vegetation ranged from 0% to 99% shoreline cover, and overhanging shade for Summer/Fall ranged from 4% to 100% shoreline cover.

Air Quality/Greenhouse Gas Emissions/Health Risk Assessment Modeling Data

E1 Air Quality and Greenhouse Gas Emissions Modeling Data

Construction Schedule (2022): Repair Sites 2-2 and 2-3, Arden Pond Mitigation Site

Month	2022 Construction Season Forecast		
	Arden Pond	**Repair Site 2-2**	**Repair Site 2-3**
January	1. Tree removal and pruning	1. Tree removal and pruning (Preferable to do in November/December when flows are are likely to be lower?) 2. Elderberry transplants (November - February)	1. Tree removal and pruning (Preferable to do in November/December when flows are are likely to be lower?) 2. Elderberry transplants (November - February)
February			
March	No activity	No activity	No activity
April			
May			3. Temporary BMPs, access roads, staging areas, and pedestrian trail reroutes
June	2. Temporary BMPs, access roads, staging areas, and pedestrian trail reroutes		4. Bike trail grading, paving, and tie-ins
July	3. Dewater ponds (block inlet channel, notch outlet channel) (2 excavators @ 3 days, 4-inch pump 80 days, 4 6-inch pumps, 7 days; 2 6-inch pumps remaining through work window intermittently run) 4. Excavate and haul material from bass pond to north berm. (49,000 cy-4 excavators, 8 Marooka tracked dump trucks@35 days) 5. Excavate and haul material from East Mitigation Site to South Berm, Channel, North Berm (26,200 cy-1 Excavator, 4 Marooka tracked dump trucks@30 days) 6. Excavate and haul material from West Migitation Site to South Berm, Channel, North Berm (125,000 cy-3 Excavator,12 Marooka tracked dump trucks @50 days) 7. Place Site 2-3 offhaul, East Mitigation Site, West Mitigation Site, Bass pond dredge material, in channel, South Berm, North Berm (330,000 cy-4 Loaders, 8 Marooka tracked dump trucks, 6 dozers@40 days) 8. Import 15,000 cy of cobble from tailing stockpiles within 15 miles of site. (5 semi-end dumps and one loader 10 days) 9. Place 13,800 cy of cobble along constructed channel bottom. (Two excavators, 10 days) 10. Excavate french drain and sidecast material into constructed berms. Fill French Drain with 1200 cy of cobble. (1 excavator, 3 marookas, 2 days) 11. Place IWM (482 Trees-~10 days @48 trees per day, 2 off-road fork lifts, two excavators) 12. Import Rock to Reconstruct Channel Outlet (1,500 tons, 7 semi-end dumps over 10 days) 13. Reconstruct Channel Outlet, remove plug in channel inlet (3 excavators @10 days)	3. Temporary BMPs, access roads, staging areas, and pedestrian trail reroutes 4. Control of water 5. Rock haul from quarry (23,200 tons-50 tons/truck/day for 60 days, 8 transfer dump trucks) 6. Launchable rock toe installation (13,800 tons: 500 tons/day/excavator@28 days = 1 excavator; 2 trucks/excavator = 2 dump trucks)) 7. Bedding and topsoil import (10,400 tons=100 tons/truck/day for 52 days, 2 belly dump trucks) 8. Bedding, soil-filled rock slope protection and tie-backs (42,000 tons: 500 tons/day/excavator @ 42 days = 2 excavators & 4 dump trucks). 9. Planting bench fill and topsoil (8,800 tons: 500 tons/day/excavator @ 18 days = 1 excavator & 2 dump trucks) 10. IWM anchorages 11. Filter fabric, planting bench earthwork, IWM installation (Haul from Chico: 80 trees, 10 trees/day, 8 days, 1 flat bed truck, 1 excavator)	5. Control of water 6. Rough grading and material export (363,300 CY:~40 days @ 9600 cy/day, 64 trucks @ 150 CY/day; 8 excavators, 8 front-end loaders @ 1,200 CY per day) 7. Rock tie-backs 8. Rock haul from quarry (141,200 tons-50 tons/truck/day for 60 days, 48 transfer dump trucks:) 9. Rock revetment installation (141,200 tons: 500 tons/day/excavator@60 days = 5 excavators; 2 trucks/excavator = 10 dump trucks)) 10. Submerged benches 11. Willow fences 12. IWM installation (haul from Chico: 240 trees, 10 trees/day/truck @ 24 days, 1 flat bed truck, 1 excavator)
August			
September			
October			
November	14. Bank protection seeding, erosion control, and winterization	12. Install rock around Howe Avenue north abutment (1 excavator & 2 dump trucks @ 20 days) 13. Planting bench fine grading 14. Seeding, erosion control, and winterization 15. Irrigation installation and winterization	13. Install rock around H Street bridge (1 excavator & 2 dump trucks @ 20 days) 14. Fine grading and seeding; erosion control blankets 15. Willow poles and container plants 16. Irrigation installation and winterization
December	Winter/BMP Monitoring	Winter/BMP Monitoring	Winter/BMP Monitoring
January

[1]Fugitive Dust PM2.5 was calculated based on a 0.1 ratio of PM2.5/PM10 as indicated in EPA 2006 AP-42 Background Document for Revisions to Fine Fraction Ratios used for AP-42 Fugitive Dust Emission Factors

Assumptions:
1 worker per piece of equipment
10 hours per equipment per day
Average trip length for workers estimated from CalEEMod

		Unit	Source
Mass Conversion Rates	453.59	g/lb	google.com

[1]Fugitive Dust PM2.5 was calculated based on a 0.1 ratio of PM2.5/PM10 as indicated in EPA 2006 AP-42 Background Document for Revisions to Fine Fraction Ratios used for AP-42 Fugitive Dust Emission Factors

Assumptions:
1 worker per piece of equipment
10 hours per equipment per day
Average trip length for workers estimated from CalEEMod

[1]Fugitive Dust PM2.5 was calculated based on a 0.1 ratio of PM2.5/PM10 as indicated in EPA 2006 AP-42 Background Document for Revisions to Fine Fraction Ratios used for AP-42 Fugitive Dust Emission Factors

Assumptions:
1 worker per piece of equipment
10 hours per equipment per day
Average trip length for workers estimated from CalEEMod

		Unit	Source
Mass Conversion Rates	453.59	g/lb	google.com

[1]Fugitive Dust PM2.5 was calculated based on a 0.1 ratio of PM2.5/PM10 as indicated in EPA 2006 AP-42 Background Document for Revisions to Fine Fraction Ratios used for AP-42 Fugitive Dust Emission Factors
Average trip length for workers estimated from CalEEMod

600	750	0.15	2.60	0.30	0.02	0.01		
750	1200	0.15	2.60	2.60	0.03	0.03		
1200	9999	0.15	2.60	2.60	0.03	0.03		

Note:

1. Tier 4 Emission Factors are converted from EPA Non-road Diesel Engine Standards. Available at www.arb.ca.gov/msprog/ordiesel/documents/Off-Road_Diesel_Stds.xls
2. Assume PM2.5 is 92% of PM10.

Subject: Construction Health Risk Assessment for the American River Common Features, Subreach 2 (Site 2-2/2-3) Project in Sacramento, CA

1 INTRODUCTION

This health risk assessment (HRA) evaluates the potential health risks associated with construction of erosion protection sites and mitigation sites along the Lower American River, Subreach 2, in Sacramento, California. Specifically, individual HRAs were conducted to evaluate health impacts due to construction occurring at Erosion Protection Sites 2-2 and 2-3, the Arden Pond Mitigation Site, and the Campus Commons Golf Course that will be used as a staging area for Site 2-3. This HRA for construction-generated toxic air contaminant (TAC) emissions was prepared in accordance with the most current Sacramento Metropolitan Air Quality Management District (SMAQMD) and California Office of Environmental Health Hazard Assessment (OEHHA) guidance and recommendations.

The focus of this HRA is to evaluate the exposure of nearby residential receptors to construction-related TACs, specifically diesel particulate matter (diesel PM), from diesel-powered equipment and vehicles used during construction and the hauling of materials. This study was conducted according to the guidance provided by SMAQMD, i.e. *Dispersion Modeling of Construction-Generated PM_{10} Emissions* (SMAQMD 2013). Additionally, in preparing this HRA, procedures detailed in OEHHA's *Air Toxic Hot Spot Program Guidance Manual for Preparation of Health and Risk Assessments* (OEHHA 2015) were followed to quantify the potential health risks experienced by nearby receptors due to project-related construction emissions.

This report is organized in two primary sections, the first discusses the analysis methodology and the second presents the results of the HRA.

2 INVENTORY OF TOXIC AIR CONTAMINANT EMISSIONS

Construction-related emissions of exhaust PM_{10}, as a surrogate for diesel PM, were determined by conducting detailed construction emissions modeling for the project. SMAQMD's Roadway Construction Emissions Model Version 9.0 was used to obtain emission factors for heavy-duty construction equipment. Default off-road equipment emission factors, default horsepower, and load factors from the model were used, also consistent with defaults used in the California Emissions Estimator Model (CalEEMod) Version 2016.3.2. Modeling assumed that at least 90 percent of heavy-duty off-road construction equipment 50 horsepower or greater would use diesel engines that meet U.S. Environmental Protection Agency (EPA) Tier 4 emissions standards, as specified in the Proposed Action. Finally, on-road emissions were calculated using California Air Resources Board (CARB) emissions factors for the vehicle types utilized during the construction phase of the project.

Construction activities associated with the project that would generate PM_{10} emissions include clearing of trees, vegetation, and loose materials; degrading and excavating the levee; installation of rock revetment; construction of a launchable-rock-filled trench; reconstruction of the levee; associated worker haul and commute trips; and implementation of mitigation sites. Construction at Sites 2-2 and 2-3, as well as the Arden Pond Mitigation Site, would occur in 2022 and take approximately seven to nine months to complete. Construction activities associated with rebuilding the Campus Commons Golf Course would occur in 2023 and take approximately six months.

PM_{10} exhaust emissions at each of these three locations would result from the use of diesel-powered heavy-duty construction equipment, diesel generators, and diesel trucks (mobile and idle) during construction. To estimate risk, average daily and annual construction emissions of PM_{10}, as a proxy for diesel PM, were computed.

The diesel PM emissions generated by off-site vehicle traffic (e.g., hauling trips) were modeled along the haul routes providing ingress and egress to each project site (see Chapter 2, "Alternatives," for haul route details). Heavy-duty, diesel-fueled equipment use would also occur at all three locations during construction. Emissions estimates from both construction equipment and on-road truck trips are shown in this appendix. In summary, the sources modeled for this construction HRA were:

- Heavy-duty construction equipment diesel PM emissions as an array of adjacent volume sources;
- Construction worker on-road emissions of diesel PM during daily commute (included in on-site emissions); and
- Truck hauling diesel PM emissions as separated line volume sources.

3 AIR DISPERSION MODELING

3.1 APPROACH

Dispersion modeling was conducted using the California Air Resources Board (CARB)-approved American Meteorological Society/Environmental Protection Agency Regulatory Model Improvement Committee modeling system (AERMOD) Version 19191, with a unit emission rate of 1 gram per second (g/s) for all modeled sources. Ground-level exhaust PM_{10} concentrations were determined at each receptor location.

These data were used in conjunction with HARP2 to estimate cancer and chronic noncancer health risk levels resulting from exposure to source emissions at each location during its construction period. The modeling included all standard regulatory default options, including the use of urban dispersion parameters and local terrain. Terrain in the project vicinity is generally flat, however terrain date were incorporated into the modeling.

3.2 AERMOD MODEL CONFIGURATION

The following input parameters were used in the model run:

- Projected Coordinate System: Universal Transverse Mercator (UTM) zone 10;
- Geographic Datum: World Geodetic System (WGS) of 1984;
- Urban land use based on AERMOD's Land Use Procedure based on the level of development within a 3-kilometer (km) radius of the project site;
- Period annual averaging of concentrations for construction years;
- Unit emission rate of 1 g/s for all sources; and
- CARB's Digital Elevation Model Files for terrain data.

3.3 INPUTS AND ASSUMPTIONS

Meteorological Data

Pre-processed meteorological data from 2012 to 2014 collected at the Sacramento Executive Airport were obtained from CARB. The Sacramento Executive Airport is the nearest and, therefore, most representative, meteorological station for the project site. The wind primarily blows from the south-southwest. Dispersion modeling applied a time-averaged, simplified representation of turbulent, atmospheric transport to approximate how pollutants are carried, mixed, dispersed, and diluted by the local winds.

Receptor Grid

A receptor grid was placed out to 1,225 meters (m) from the project site boundary to encompass nearby residential and commercial land uses. The grid was placed with 25-meter spacing between receptors.

Discrete receptors were removed from the project site. All receptors were given a flagpole receptor height of 1.8m to represent average breathing height per OEHHA guidance (OEHHA 2015:4-22). All receptor points are indicated in the AERMOD output files within this appendix. .

Source Type and Dimensions

For each project site where construction activities would occur, construction emission sources were modeled as an array of adjacent volume sources. Each volume source was assumed to have 20 m sides, an internal lateral dimension of 9.3 m, and an internal vertical dimension of 1.0 m, the latter two attributes were calculated from the length of the volume source side.

Each site's haul routes (with separate ingress and egress points) were modeled as line sources to represent a series of volume sources. The line-volume sources represent the haul truck emissions traveling to and from each site. These line sources were assumed to have an adjacent configuration of volume sources spaced at 10 meter intervals, with a 5.1 m plume height, 9.0 m plume width, and a 2.6 meter release height. These were calculated based on the assumption that trucks traveling on these routes would have an average height of 3 m (10 feet) and width of 2.4 m (8 feet).

Figures 1, 2, and 3 below depict the source locations and haul routes for each of the three locations assessed.

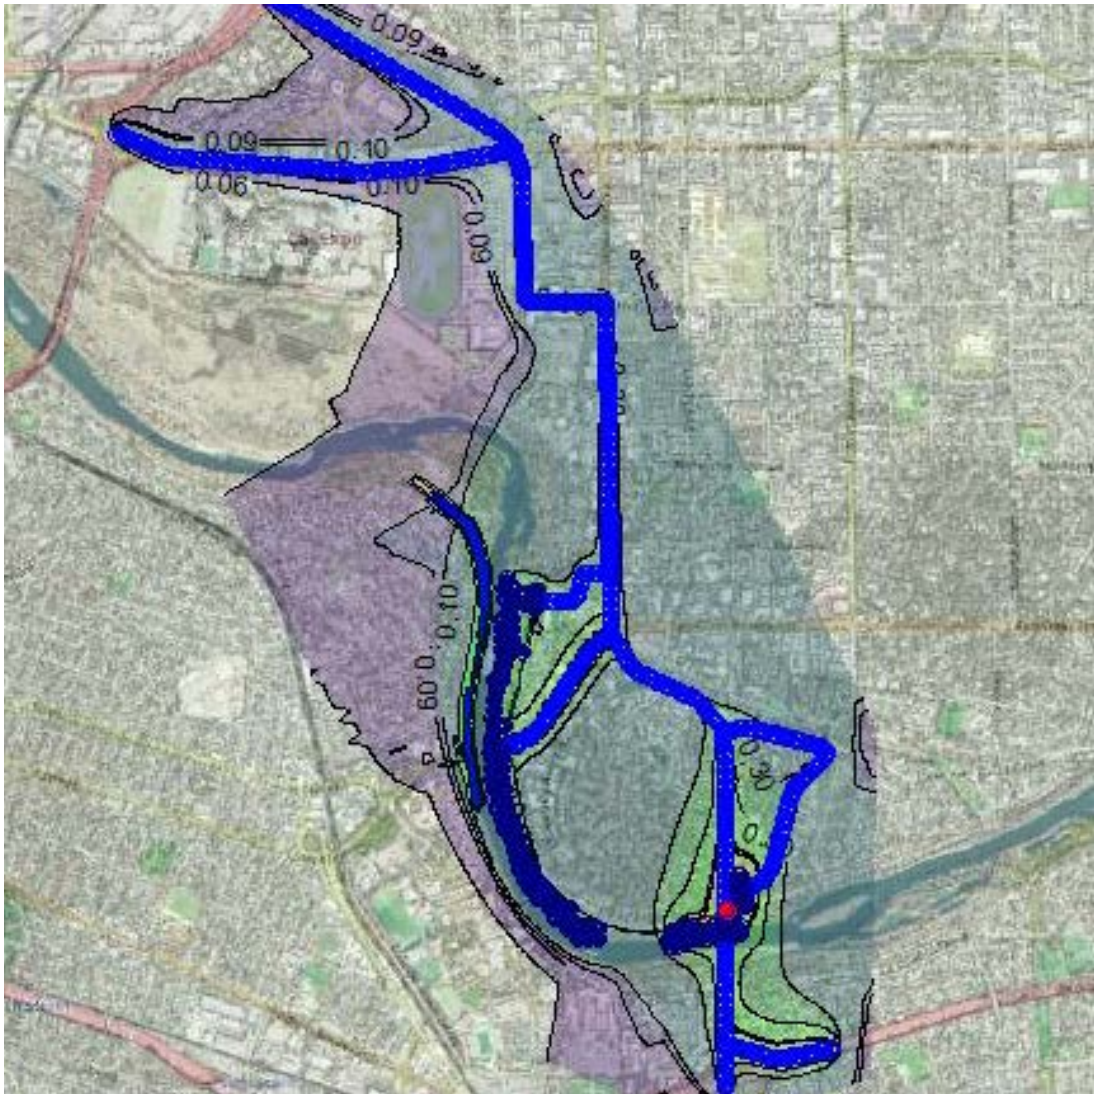

Figure 2 Emissions Sources – Arden Pond Mitigation Site (2022)

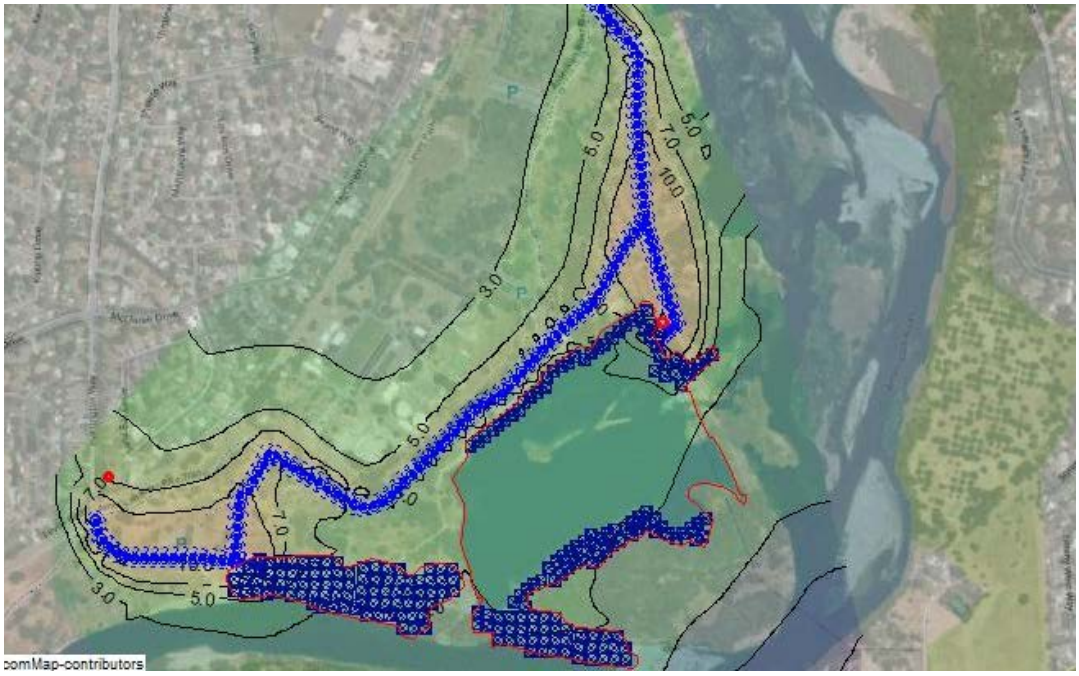

Figure 3 Emissions Sources – Campus Commons Golf Course Golf Course (2023)

4 HEALTH RISK CALCULATIONS

4.1 CANCER AND CHRONIC NONCANCER RISK

To analyze impacts to sensitive receptors, the resulting pollutant concentrations from the AERMOD dispersion analysis was applied to the Hotspots Analysis and Reporting Program Version 2.0.3 Version 2.0.3 (ADMRT 19121), or HARP2. CARB developed HARP2 as a tool to implement risk assessments and incorporates requirements from OEHHA's *Air Toxics Hot Spot Program Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments* (OEHHA 2015).

Total annual tons of PM_{10} exhaust from project construction emissions calculation results were converted to pounds per year and pounds per day, which were then input into HARP2. The estimates of potential residential cancer risk were prepared in accordance with OEHHA Guidance. The cancer risk was estimated for construction occurring in 2022 and 2023. Risk parameters for cancer and non-cancer scenarios are presented in Table 1, below.

Table 1 Risk Parameters for Cancer and Non-Cancer Risk from Construction Emissions[1]

Risk Parameters	Residential Receptors
Analysis Type	Cancer Risk and Chronic Risk (Non-cancer)
Receptor Type	Residential
Exposure Duration	1 year
Starting Age	3rd Trimester
Intake Rate Percentile	OEHHA Derived Method
Risk Pathways Evaluated	Minimum Residential Pathways
Deposition Rate	0.05 m/s
FAH	Off
Climate	Mixed

Notes: OEHHA = Office of Environmental Health Hazard Assessment; m/s = meters per second; FAH = fraction of time at home

[1] Analysis was prepared consistent with OEHHA Guidance (OEHHA 2015).

Source: Prepared by Ascent Environmental, Inc., in 2021

5 RESULTS

5.1 CONSTRUCTION

Based on the air dispersion modeling and risk calculations discussed above, the increased cancer and chronic noncancer risks to nearby receptors at each construction location due to project-related diesel PM emissions are presented in Table 2 below.

Table 2 Cancer and Chronic Noncancer Health Risks due to Construction Emissions[1]

Construction Location	Maximum Chronic Health Hazard Index	Maximum Cancer Risk Modeled (chances per million)	Maximum Exposed Individual Resident (MEIR) Cancer Risk (chances per million)
Erosion Protection Sites 2-2 and 2-3	0.007	5.97	< 5.97
Arden Pond Mitigation Site	0.04	35.6	6.54
Campus Commons Golf Course	0.0005	0.45	< 0.45

Source: Prepared by Ascent Environmental, Inc., in 2021

Figures 4, 5, and 6 graphically depict the maximum cancer risk at nearby receptors due to construction emissions as colored contours radiating outward from the site. Considering the SMAQMD threshold of significance of 10 chances in a million for cancer risk and a health hazard index threshold of less than 1.0, exposure of nearby residential receptors to construction-related TAC emissions would not result in cancer or chronic noncancer health risks that exceed the threshold of significance at any construction location.

Figure 4 Maximum Cancer Risk – Erosion Protection Sites 2-2 and 2-3 (2022)

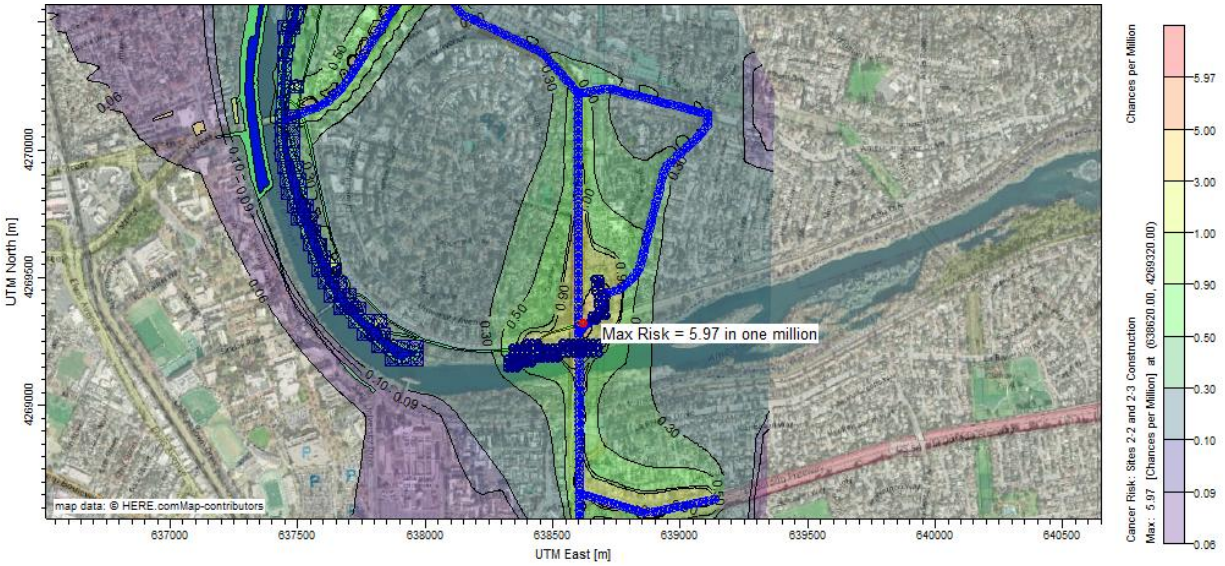

Figure 5 Maximum Cancer Risk and MEIR – Arden Pond Mitigation Site (2022)

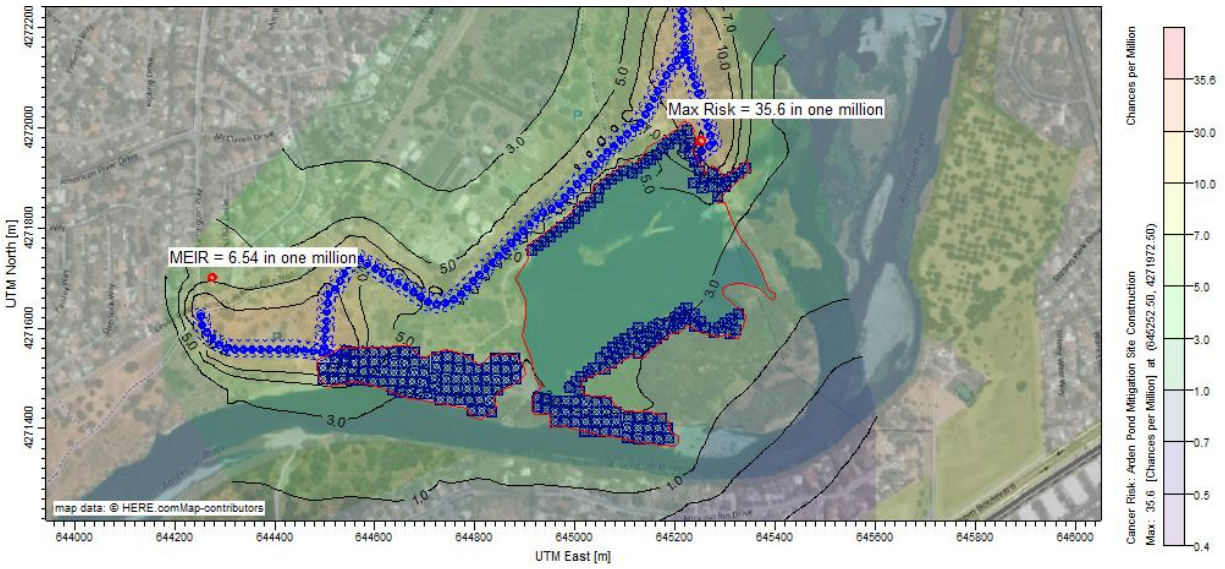

Figure 6 Maximum Cancer Risk – Campus Commons Golf Course Golf Course (2023)

As worker risk would not be higher than the modeled risk to residential receptors, this was not modeled.

Conclusion

Construction-generated TACs would not expose nearby receptors to significant cancer or chronic noncancer health risks at any of the three construction locations.

                                                ***     MODEL SETUP OPTIONS
SUMMARY       ***
 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
- - - - - - - - - - - - - - - - - - - - - - - - - - -

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses URBAN Dispersion Algorithm for the SBL for  1059 Source(s),
   for Total of    1 Urban Area(s):
   Urban Population =    501900.0 ;  Urban Roughness Length =  1.000 m

 **Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.
        6. Urban Roughness Length of 1.0 Meter Assumed.

 **Other Options Specified:
        CCVR_Sub - Meteorological data includes CCVR substitutions
        TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  PM_10

 **Model Calculates  2 Short Term Average(s) of:   1-HR  24-HR
     and Calculates ANNUAL Averages

 **This Run Includes:   1059 Source(s);       1 Source Group(s); and
7697 Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:   1059 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
```

```
                and:      0 RLINE/RLINEXT source(s)
                and:      0 OPENPIT source(s)
                and:      0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  14134

 **Output Options Selected:
          Model Outputs Tables of ANNUAL Averages by Receptor
          Model Outputs Tables of Highest Short Term Values by Receptor
(RECTABLE Keyword)
          Model Outputs External File(s) of High Values for Plotting
(PLOTFILE Keyword)
          Model Outputs Separate Summary File of High Ranked Values
(SUMMFILE Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm
Hours
                                                                   m for
Missing Hours
                                                                   b for
Both Calm and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     9.14 ;
Decay Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC
;  Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      5.0 MB of RAM.

 **Input Runstream File:          aermod.inp
 **Output Print File:             aermod.out

 **Detailed Error/Message File:   2021 ARCF 2-2 2-3.err
 **File for Summary of Results:   2021 ARCF 2-2 2-3.sum
