SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD): August 6, 2019

B. DISTRICT OFFICE, FILE NAME, AND NUMBER: Sacramento District, MARIGOLD MINE, SPK-1993-00627

C. PROJECT LOCATION AND BACKGROUND INFORMATION:

State: Nevada County/parish/borough: Humboldt County City: Valmy
Center coordinates of site (lat/long in degree decimal format): Lat. 40.7251339612012°, Long. -117.175231327162°
Universal Transverse Mercator: 11 485201.72 4508259.82

Name of nearest waterbody: Cottonwood Creek
Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: N/A
Name of watershed or Hydrologic Unit Code (HUC): Dixie Valley, 16060001

☐ Check if map/diagram of review area and/or potential jurisdictional areas is/are available upon request.

☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc…) are associated with this action and are recorded
on a different JD form:

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY):

☒ Office (Desk) Determination. Date: August 6, 2019
☐ Field Determination. Date(s):

SECTION II: SUMMARY OF FINDINGS

A. RHA SECTION 10 DETERMINATION OF JURISDICTION.

There are no “navigable waters of the U.S.” within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in
the review area. [Required]

☐ Waters subject to the ebb and flow of the tide.

☐ Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign
commerce. Explain:

B. CWA SECTION 404 DETERMINATION OF JURISDICTION.

There are no “waters of the U.S.” within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area. [Required]

1. Waters of the U.S.

   a. Indicate presence of waters of U.S. in review area (check all that apply): 1

      ☐ TNWs, including territorial seas
      ☐ Wetlands adjacent to TNWs
      ☐ Relatively permanent waters2 (RPWs) that flow directly or indirectly into TNWs
      ☐ Non-RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
      ☐ Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
      ☐ Impoundments of jurisdictional waters
      ☐ Isolated (interstate or intrastate) waters, including isolated wetlands

   b. Identify (estimate) size of waters of the U.S. in the review area:

      Non-wetland waters: linear feet, wide, and/or acres.
      Wetlands: acres.

   c. Limits (boundaries) of jurisdiction based on: Pick List

      Elevation of established OHWM (if known):

2. Non-regulated waters/wetlands (check if applicable): 3

   ☒ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined to be
   not jurisdictional. Explain: One isolated impoundment totaling 21.35 acres, six isolated intermittent channels that exhibit
   Ordinary High Water Marks (OHWM) for 68,621 linear feet and seven isolated wetlands, totaling 5.57 acres, are located within
   the review area.

   Cottonwood Creek is an intermittent channel that exhibits an OHWM for 37,607 linear feet within the review area. Wetlands
   Unnamed Spring Area A (0.43 acre), Unnamed Spring Area C (0.05 acre), Double Source Spring (0.22 acre), Ames C (0.32
   acre), Ames G (4.38 acres), and Ames O (0.14 acres) are adjacent to but do not directly abut Cottonwood Creek.

   1 Boxes checked below shall be supported by completing the appropriate sections in Section III below.
   2 For purposes of this form, an RPW is defined as a tributary that is not a TNW and that typically flows year-round or has continuous flow at least
   “seasonally” (e.g., typically 3 months).
   3 Supporting documentation is presented in Section III.F.
Cottonwood Creek Diversion is an intermittent channel that exhibits an OHWM for 7,597 linear feet within the review area.

North Fork of Trout Creek is an intermittent channel that exhibits an OHWM for 3,030 linear feet within the review area. Highwall Seep (0.03 acres) is adjacent to but does not directly abut the North Fork of Trout Creek.

Trout Creek is an intermittent channel that exhibits an OHWM for 2,940 linear feet within the review area.

Historic Trout Creek is an intermittent channel that exhibits an OHWM for 8,218 linear feet within the review area.

Unnamed Eastern Drainage (D30) is an intermittent channel that exhibits an OHWM for 9,229 linear feet within the review area.

All delineated channels and wetlands are isolated features that drain toward but have no direct or indirect connection to Humboldt River. The Humboldt River drains directly to the Rye Patch Reservoir. The Rye Patch reservoir is the closest Traditional Navigable Water (TNW). The subject channels have discrete termini and no connection to a downstream tributary or waterbody. The only known use of these drainages is storm water flow conveyance. These drainages have not historically been used and are not susceptible to use in interstate or foreign commerce. Therefore, the wetlands and channels within the delineation boundary are isolated, intrastate waters with no connection to interstate commerce and are not jurisdictional.

SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW
   Identify TNW:
   
   Summarize rationale supporting determination:

2. Wetland adjacent to TNW
   Summarize rationale supporting conclusion that wetland is “adjacent”:

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY):

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under *Rapanos* have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are “relatively permanent waters” (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary with perennial flow, skip to Section III.D.4.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody4 is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offshore. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

   (i) General Area Conditions:
      Watershed size: Pick List

---

4 Note that the Instructional Guidebook contains additional information regarding swales, ditches, washes, and erosional features generally and in the arid West.
Drainage area: [Pick List]
Average annual rainfall: [inches]
Average annual snowfall: [inches]

(ii) Physical Characteristics:
(a) Relationship with TNW:
- Tributary flows directly into TNW.
- Tributary flows through [Pick List] tributaries before entering TNW.

Project waters are [Pick List] river miles from TNW.
Project waters are [Pick List] river miles from RPW.
Project waters are [Pick List] aerial (straight) miles from TNW.
Project waters are [Pick List] aerial (straight) miles from RPW.

Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW\(^5\):
Tributary stream order, if known:

(b) General Tributary Characteristics (check all that apply):

- Tributary is: Natural
- Artificial (man-made). Explain:
- Manipulated (man-altered). Explain:

Tributary properties with respect to top of bank (estimate):
- Average width: [feet]
- Average depth: [feet]
- Average side slopes: [Pick List].

Primary tributary substrate composition (check all that apply):
- Silts
- Sands
- Gravel
- Concrete
- Muck
- Cobble
- Bedrock
- Vegetation. Type/% cover:
- Other. Explain:

Tributary condition/stability [e.g., highly eroding, sloughing banks]. Explain:
Presence of run/riffle/pool complexes. Explain:
Tributary geometry: [Pick List]
Tributary gradient (approximate average slope): [%]

(c) Flow:
Tributary provides for: [Pick List]
Estimate average number of flow events in review area/year: [Pick List]
Describe flow regime:
Other information on duration and volume:

Surface flow is: [Pick List]. Characteristics:
Subsurface flow: [Pick List]. Explain findings:
- Dye (or other) test performed:

Tributary has (check all that apply):
- Bed and banks
- OHWM\(^6\) (check all indicators that apply):
  - clear, natural line impressed on the bank
  - changes in the character of soil
  - shelving
  - vegetation matted down, bent, or absent
  - leaf litter disturbed or washed away
  - sediment deposition
  - water staining
  - the presence of litter and debris
  - destruction of terrestrial vegetation
  - the presence of wrack line
  - sediment sorting
  - scour
  - multiple observed or predicted flow events
  - abrupt change in plant community

---

\(^5\) Flow route can be described by identifying, e.g., tributary a, which flows through the review area, to flow into tributary b, which then flows into TNW.

\(^6\) A natural or man-made discontinuity in the OHWM does not necessarily sever jurisdiction [e.g., where the stream temporarily flows underground, or where the OHWM has been removed by development or agricultural practices]. Where there is a break in the OHWM that is unrelated to the waterbody’s flow regime (e.g., flow over a rock outcrop or through a culvert), the agencies will look for indicators of flow above and below the break.
If factors other than the OHWM were used to determine lateral extent of CWA jurisdiction (check all that apply):

- Discontinuous OHWM. Explain:

High Tide Line indicated by:
- oil or scum line along shore objects
- fine shell or debris deposits (foreshore)

Mean High Water Mark indicated by:
- survey to available datum;
- physical markings;
- vegetation lines/changes in vegetation types.

Physical markings/characteristics
- other (list):

(iii) **Chemical Characteristics:**
Characterize tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc.). Explain:
Identify specific pollutants, if known:

(iv) **Biological Characteristics. Channel supports (check all that apply):**
- Riparian corridor. Characteristics (type, average width):
- Wetland fringe. Characteristics:
- Habitat for:
  - Federally Listed species. Explain findings:
  - Fish/spawn areas. Explain findings:
  - Other environmentally-sensitive species. Explain findings:
  - Aquatic/wildlife diversity. Explain findings:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) **Physical Characteristics:**
(a) **General Wetland Characteristics:**
- Properties:
  - Wetland size: acres
  - Wetland type. Explain:
  - Wetland quality. Explain:
- Project wetlands cross or serve as state boundaries. Explain:

(b) **General Flow Relationship with Non-TNW:**
- Flow is: Pick List. Explain:
  - Surface flow is: Pick List
    - Characteristics:
  - Subsurface flow: Pick List. Explain findings:
    - Dye (or other) test performed:

(c) **Wetland Adjacency Determination with Non-TNW:**
- Directly abutting
- Not directly abutting
  - Discrete wetland hydrologic connection. Explain:
  - Ecological connection. Explain:
  - Separated by berm/barrier. Explain:

(d) **Proximity (Relationship) to TNW**
- Project wetlands are Pick List river miles from TNW.
- Project waters are Pick List aerial (straight) miles from TNW.
- Flow is from: Pick List.
- Estimate approximate location of wetland as within the Pick List floodplain.

(ii) **Chemical Characteristics:**
Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics; etc.). Explain:
Identify specific pollutants, if known:

(iii) **Biological Characteristics. Wetland supports (check all that apply):**

---

Riparian buffer. Characteristics (type, average width):
Vegetation type/percent cover. Explain:
Habitat for:
- Federally Listed species. Explain findings:
- Fish/spawn areas. Explain findings:
- Other environmentally-sensitive species. Explain findings:
- Aquatic/wildlife diversity. Explain findings:

3. Characteristics of all wetlands adjacent to the tributary (if any)
All wetland(s) being considered in the cumulative analysis: Pick List
Approximately acres in total are being considered in the cumulative analysis.

For each wetland, specify the following:

| Directly abuts? (Y/N) | Size (in acres) | Directly abuts? (Y/N) | Size (in acres) |

Summarize overall biological, chemical and physical functions being performed:

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the Rapanos Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below:

1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to Section III.D:

2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY):

1. TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
- TNWs: linear feet, wide, Or acres.
- Wetlands adjacent to TNWs: acres.

2. RPWs that flow directly or indirectly into TNWs.
Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial:

Tributaries of TNW where tributaries have continuous flow “seasonally” (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

Provide estimates for jurisdictional waters in the review area (check all that apply):
- Tributary waters: ______ linear feet ______ wide.
- Other non-wetland waters: ______ acres.

Identify type(s) of waters:

3. Non-RPWs that flow directly or indirectly into TNWs.
   □ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has a significant nexus with a TNW is jurisdictional. Data supporting this conclusion is provided at Section III.C.

   Provide estimates for jurisdictional waters within the review area (check all that apply):
   - Tributary waters: ______ linear feet ______ wide.
   - Other non-wetland waters: ______ acres.

   Identify type(s) of waters:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.
   □ Wetlands directly abutting RPW and thus are jurisdictional as adjacent wetlands.
   □ Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW:

   □ Wetlands directly abutting an RPW where tributaries typically flow “seasonally.” Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW:

   Provide acreage estimates for jurisdictional wetlands in the review area: ______ acres.

5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNWs.
   □ Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

   Provide acreage estimates for jurisdictional wetlands in the review area: ______ acres.

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.
   □ Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

   Provide estimates for jurisdictional wetlands in the review area: ______ acres.

7. Impoundments of jurisdictional waters.
   As a general rule, the impoundment of a jurisdictional tributary remains jurisdictional.
   - Demonstrate that impoundment was created from “waters of the U.S.,” or
   - Demonstrate that water meets the criteria for one of the categories presented above (1-6), or
   - Demonstrate that water is isolated with a nexus to commerce (see E below).

E. ISOLATED [INTERSTATE OR INTRA-STATE] WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE, INCLUDING ANY SUCH WATERS (CHECK ALL THAT APPLY):

- which are or could be used by interstate or foreign travelers for recreational or other purposes.
- from which fish or shellfish are or could be taken and sold in interstate or foreign commerce.
- which are or could be used for industrial purposes by industries in interstate commerce.
- Interstate isolated waters. Explain:
- Other factors. Explain:

8See Footnote # 3.
9 To complete the analysis refer to the key in Section III.D.6 of the Instructional Guidebook.
10 Prior to asserting or declining CWA jurisdiction based solely on this category, Corps Districts will elevate the action to Corps and EPA HQ for review consistent with the process described in the Corps/EPA Memorandum Regarding CWA Act Jurisdiction Following Rapanos.
Identify water body and summarize rationale supporting determination:

Provide estimates for jurisdictional waters in the review area (check all that apply):

☐ Tributary waters: __________ linear feet, __________ wide.
☐ Other non-wetland waters: __________ acres.
Identify type(s) of waters:
☐ Wetlands: __________ acres.

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS (CHECK ALL THAT APPLY):

☐ If potential wetlands were assessed within the review area, these areas did not meet the criteria in the 1987 Corps of Engineers Wetland Delineation Manual and/or appropriate Regional Supplements.
☐ Review area included isolated waters with no substantial nexus to interstate (or foreign) commerce. These isolated waters include one isolated impoundment totaling 21.35 acres, six isolated intermittent channels that exhibit Ordinary High Water Marks (OHWM) for 68,621 linear feet and seven isolated wetlands, totaling 5.57 acres, are located within the review area.
☐ Prior to the Jan 2001 Supreme Court decision in “SWANCC,” the review area would have been regulated based solely on the “Migratory Bird Rule” (MBR).
☐ Waters do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction. Explain:
☐ Other: (explain, if not covered above): The wetlands in the review area are isolated features associated with adjacent upland swales that drain toward, but do not reach, the Humboldt River and have no direct or indirect connection to the nearest TNW, the Rye Patch Reservoir.

Provide acreage estimates for non-jurisdictional waters in the review area, where the sole potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

☐ Non-wetland waters (i.e., rivers, streams): __________ linear feet, __________ wide.
☐ Lakes/ponds: __________ 21.35 acres.
☐ Other non-wetland waters: __________ acres. List type of aquatic resource:
☐ Wetlands: __________ 5.57 acres.

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the “Significant Nexus” standard, where such a finding is required for jurisdiction (check all that apply):

☐ Non-wetland waters (i.e., rivers, streams): __________ linear feet, __________ wide.
☐ Lakes/ponds: __________ acres.
☐ Other non-wetland waters: __________ acres. List type of aquatic resource:
☐ Wetlands: __________ acres.

SECTION IV: DATA SOURCES.

A. SUPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked and requested, appropriately reference sources below):

☐ Office concurs with data sheets/delineation report.
☐ Office does not concur with data sheets/delineation report.
☐ Data sheets prepared by the Corps:
☐ Corps navigable waters’ study:
☐ U.S. Geological Survey Hydrologic Atlas:
☐ USGS NHD data.
☐ USGS 8 and 12 digit HUC maps.
☐ U.S. Geological Survey map(s). Cite scale & quad name: 1:24K; Valmy
☐ National wetlands inventory map(s). Cite name: https://www.fws.gov/wetlands/Data/Mapper.html. Accessed May 31, 2019
☐ State/Local wetland inventory map(s):
☐ FEMA/FIRM maps:
☐ 100-year Floodplain Elevation is: (National Geodectic Vertical Datum of 1929)
☐ Photographs: ☐ Aerial (Name & Date):
☐ Applicable/supporting case law:
B. ADDITIONAL COMMENTS TO SUPPORT JD: Cottonwood and Trout Creeks originate in the Battle Mountains and flow north toward the Reese and Humboldt Rivers. Throughout the reaches of both creeks, there are areas where there is no evidence of flow and the creeks virtually disappear. Past determinations (SPK-1993-00627 January 10, 2014) have indicated that both creeks end as they reach flat land and that there are no differences in vegetation between adjacent areas and what would be the creek bed. North of I-80, distinct OHWM features/indicators continue to diminish until no evidence of a channel is found. Typical stream morphology is that as a stream moves downstream and continues to merge with other tributaries, it becomes wider. This is not the case with Trout and Cottonwood Creeks. As they reach the flat, valley floor, both streams become narrower and shallower until they fade completely and lose OHWM indicators or even swale characteristics. As per information from past determinations (SPK-1993-00627 January 10, 2014), the Humboldt River in the area downstream of the proposed project area is a recharge area and is a losing stream and not gaining water from groundwater discharge. Based on the available information, Trout and Cottonwood Creeks have no hydrologic connection to the Humboldt River because flows are lost to evapo-transpiration and infiltration prior to reaching the vicinity of the Humboldt River. Because the depth to groundwater is in excess of 35-feet As noted in past determinations (SPK-1993-00627 January 10, 2014) and due to the distance between the nearest TNW and these aquatic resources (85-miles) there is no potential for the creeks to contribute to recharge of the Humboldt River. The area is relatively remote with limited services and virtually no water-dependent activities. The Corps is not aware of any interstate commerce within the Ralston Valley and concludes that the drainages associated with the Marigold Mine Project are all intrastate, isolated waters located in a closed basin and are therefore non-jurisdictional.
