# APPROVED JURISDICTIONAL DETERMINATION FORM **U.S. Army Corps of Engineers**

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

	CTION I: BACKGROUND INFORMATION
Α.	REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD): June 8, 2020
В.	DISTRICT OFFICE, FILE NAME, AND NUMBER: Sacramento District, Cove Helen Underground Mine, SPK-2019-00779
C.	PROJECT LOCATION AND BACKGROUND INFORMATION:  State: Nevada County/parish/borough: Lander County City: Battle Mountain  Center coordinates of site (lat/long in degree decimal format): Lat. 40.36784°, Long117.17779°  Universal Transverse Mercator: 11 484905.64 4468600.33  Name of nearest waterbody: Reese River  Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: Rye Patch Reservoir  Name of watershed or Hydrologic Unit Code (HUC): Reese, 16040107  ☐ Check if map/diagram of review area and/or potential jurisdictional areas is/are available upon request.  ☐ Check if other sites (e.g., offsite mitigation sites, disposal sites, etc) are associated with this action and are recorded on a different JD form:
D.	REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY):  ☑ Office (Desk) Determination. Date: June 9, 2020 ☐ Field Determination. Date(s):
SE	CTION II: SUMMARY OF FINDINGS
	RHA SECTION 10 DETERMINATION OF JURISDICTION.
	ere Are no "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) he review area. [Required] Waters subject to the ebb and flow of the tide. Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce. Explain:
В.	CWA SECTION 404 DETERMINATION OF JURISDICTION.
The	ere Are "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area. [Required]
	1. Waters of the U.S.  a. Indicate presence of waters of U.S. in review area (check all that apply):  TNWs, including territorial seas  Wetlands adjacent to TNWs Relatively permanent waters² (RPWs) that flow directly or indirectly into TNWs Non-RPWs that flow directly or indirectly into TNWs Wetlands directly abutting RPWs that flow directly or indirectly into TNWs Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs Impoundments of jurisdictional waters Isolated (interstate or intrastate) waters, including isolated wetlands
	<ul> <li>b. Identify (estimate) size of waters of the U.S. in the review area:         Non-wetland waters: 116,270 linear feet, 1-15 feet wide, and/or acres.     </li> <li>Wetlands: acres.</li> </ul>
	c. Limits (boundaries) of jurisdiction based on: Established by OHWM Elevation of established OHWM (if known):
	2. Non-regulated waters/wetlands (check if applicable): <sup>3</sup> Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined to be not

# **SECTION III: CWA ANALYSIS**

jurisdictional. Explain:

<sup>&</sup>lt;sup>1</sup> Boxes checked below shall be supported by completing the appropriate sections in Section III below. <sup>2</sup> For purposes of this form, an RPW is defined as a tributary that is not a TNW and that typically flows year-round or has continuous flow at least "seasonally" (e.g., typically 3 months).

3 Supporting documentation is presented in Section III.F.

### A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

### 1. TNW

Identify TNW:

Summarize rationale supporting determination:

### 2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent":

# B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY):

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under *Rapanos* have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are "relatively permanent waters" (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary with perennial flow, skip to Section III.D.4.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody<sup>4</sup> is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

## 1. Characteristics of non-TNWs that flow directly or indirectly into TNW

## (i) General Area Conditions:

Watershed size: Pick List
Drainage area: 40,000 acres
Average annual rainfall: 9 inches
Average annual snowfall: 17 inches

### (ii) Physical Characteristics:

(a) Relationship with TNW:

☐ Tributary flows directly into TNW.

☐ Tributary flows through 1 tributaries before entering TNW.

Project waters are 30 (or more) river miles from TNW.

Project waters are 1 (or less) river miles from RPW.

Project waters are 30 (or more) aerial (straight) miles from TNW.

Project waters are **1 (or less)** aerial (straight) miles from RPW.

Project waters cross or serve as state boundaries. Explain: **No. The waters within the project area are located entirely within the State of Nevada.** 

Identify flow route to TNW<sup>5</sup>: The Rye Patch Reservoir, an instream impoundment of the Humboldt River, has been determined to meet the 2-parameter test (navigable and interstate commerce connection) of a Navigable In Fact TNW at the point of confluence with the Humboldt River. The waters in the

<sup>&</sup>lt;sup>4</sup> Note that the Instructional Guidebook contains additional information regarding swales, ditches, washes, and erosional features generally and in the arid West.

<sup>&</sup>lt;sup>5</sup> Flow route can be described by identifying, e.g., tributary a, which flows through the review area, to flow into tributary b, which then flows into TNW.

review area drain through the Reese River. The Reese River drains directly to the Humboldt River (a perennial RPW) which flows directly into the Rye Patch Reservoir at a distance of approximately 180 miles

Tributary stream order, if known: Drainage D2, D3, D4 and D5 are 1<sup>st</sup> order streams. Drainage D1 combines with D3 within the review area to become a 2<sup>nd</sup> order stream. The Reese River is a 4<sup>th</sup> order stream within the project area.

(b)	General Tributary Characteristics (check all that apple Tributary is:  Natural Artificial (man-made). Explain: Manipulated (man-altered). Explain:

Summarize overall biological, chemical and physical functions being performed:

#### C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the *Rapanos* Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below:

 Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to Section III.D:

The Channels labeled Drainage D1-D5 on attached map Figure 7 were each demonstrated to be ephemeral stream channels that flow through D1 to the Reese River, an intermittent river with continuous seasonal flow. The Reese River drains directly to the Humboldt River, an RPW, which drains directly to the Rye Patch Reservoir a waterbody that meets the 2 criteria for a Traditional Navigable Water (TNW) at its confluence with the river.

Nelson et al. (1992) found *Oncorhynchus spp.* (fish) abundance to be positively influenced by proximity to sedimentary inputs within the Humboldt River watershed. The findings of Achord *et al.* (2007) indicate that *Oncorhynchus spp.* exhibit fine-scale population structure and local adaptations to their natal habitats. Hilborn *et al.* (2003), found that the variation among local environmental conditions decreases extinction risk and increase sustainability of long-term species reproduction. These studies demonstrate that the individual tributaries to the Rye Patch Reservoir have a buffering effect on variability of the aggregate fish community and these populations become weaker as habitat diversity is reduced. The subject channels each have a significant effect on the physical, chemical and biological integrity of the Rye Patch Reservoir.

The findings of Maurer et al. (2008) demonstrated that unit-area runoff from perennial watersheds is greater than unit-area runoff from ephemeral watersheds. They found that ephemeral tributaries located within alluvial fans like Drainages D1-D5 reduce stormwater and non-point source pollutant input to the downstream receiving waters. Drainages D1-D5 accomplish this by allowing infiltration that also provides basin aquifer recharge.

The Channels labeled Drainage D1-D5 on attached map Figure 7 each provide water and life cycle support functions for fish species present in the downstream TNW. Each provides water and gravel to perennial tributaries to the Humboldt River thereby providing spawning and rearing habitat for trout species that migrate downstream to the Rye Patch Reservoir. This process, which occurs in each of these tributaries, transfers nutrients and organic carbon from the headwaters to the downstream TNW and supports downstream food webs. The Channels labeled Drainage D1-D5 have a significant effect on the chemical, physical and biological integrity of the Rye Patch Reservoir that is more than speculative or insubstantial.

- 2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:
- 3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D.	DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT
	APPLY):

1.	TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:  TNWs: linear feet, wide, Or acres.  Wetlands adjacent to TNWs: acres.
2.	<ul> <li>RPWs that flow directly or indirectly into TNWs.</li> <li>☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial:</li> <li>☑ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: The USGS has no gauge on the Reese River. The USGS mapped the Reese River within the project area as an intermittent river and a perennial river outside of and downstream of the project area.</li> </ul>
	Provide estimates for jurisdictional waters in the review area (check all that apply):  Tributary waters:  22,800 linear feet 1-15 feet wide.  Other non-wetland waters:  Identify type(s) of waters:
3.	Non-RPWs <sup>8</sup> that flow directly or indirectly into TNWs.  ☑ Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has a significant nexus with a TNW is jurisdictional. Data supporting this conclusion is provided at Section III.C.
	Provide estimates for jurisdictional waters within the review area (check all that apply):  Tributary waters: 93,470 linear feet, 1-9 feet wide.  Other non-wetland waters: acres.  Identify type(s) of waters:
4.	Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.  Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.  Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW:
	□ Wetlands directly abutting an RPW where tributaries typically flow "seasonally." Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW:
	Provide acreage estimates for jurisdictional wetlands in the review area: acres.
5.	Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNWs.  Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisidictional. Data supporting this conclusion is provided at Section III.C.
	Provide acreage estimates for jurisdictional wetlands in the review area: acres.

<sup>8</sup>See Footnote #3.

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.    Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.  Provide estimates for jurisdictional waters.³  As a general rule, the impoundment of a jurisdictional tributary remains jurisdictional.    Demonstrate that impoundment was created from "waters of the U.S." or     Demonstrate that water mest the criteria for one of the categories presented above (1-6), or     Demonstrate that water is isolated with a nexus to commerce (see E below).  E. ISOLATED [INTERSTATE OR INTRA-STATE] WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE, INCLUDING ANY SUCHWATERS (CHECK ALL THAT APPLY): 0   Which are or could be used by interstate or foreign travelers for recreational or other purposes.     from which fish or shellfish are or could be taken and sold in interstate or foreign commerce.     which are or could be used for industrial purposes by industries in interstate commerce.     Interstate isolated waters. Explain:     Other factors. Explain:     Identify water body and summarize rationale supporting determination:     Provide estimates for jurisdictional waters in the review area (check all that apply):     Tributary waters:     Wetlands: acres.     Identify bye(s) of waters:     Wetlands: acres.     Wetlands: acres.     Prior to the Jan 2001 Supreme Court decision in "SWAVCC," the review area would have been regulated based solely on the "Migratory Bird Rule" (MBR).     Prior to the Jan 2001 Supriment Check all that apply:     Provide acreage estimates for non-jurisdictional waters in the review area, where the <u>sole</u> potential basis of jurisdiction is the MBR factors (i.e., prese, streams):   inear feet, wide.     Lakes/ponds: acres.     Other non-wetl			
7. Impoundments of jurisdictional waters.*  As a general rule, the impoundment of a jurisdictional tributary remains jurisdictional.    Demonstrate that impoundment was created from 'vaters of the U.S.," or   Demonstrate that water mests the criteria for one of the categories presented above (1-6), or   Demonstrate that water is isolated with a nexus to commerce (see E below).  E. ISOLATED [INTERSTATE OR INTRA-STATE] WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE, INCLUDING ANY SUCH WATERS (CHECK ALL THAT APPLY): 10   which are or could be used by interstate or foreign travelers for recreational or other purposes.   which are or could be used by interstate or foreign travelers for recreational or other purposes.   which are or could be used of industrial purposes by industries in interstate commerce.   which are or could be used of industrial purposes by industries in interstate commerce.   other factors. B. ADDITIONAL COMMENTS TO SUPPORT JD: Drainages D1-D5 are ephemeral tributaries to the Reese River. The Reese River is mapped (USGS) as an intermittent river within the project area that becomes a perennial river outside of the project area before it flows directly to the Humboldt River, an RPW and mapped (USGS) perennial river which flows directly into the Rye Patch Reservoir a Navigable in Fact Traditional Navigable Water. Each stream is documented on individual forms located in the Cove Helen Underground Mine Project Waters of the United States Inventory and Preliminary Jurisdictional Assessment Lander County, Nevada. Figure 7, prepared by Confluence Water Resources, LLC, September, 2019. These sheets include the general area conditions, physical characteristics, chemical characteristics, and biological characteristics of each water evaluated so the responses provided in B and D of this document should be considered averages.
